**APPENDIX G**

**Traffic Signal Warrant Worksheets**

# PEAK HOUR VOLUME WARRANT (Rural Areas)

## Existing + Ambient Growth

Major Street Name = **Waterman Avenue**

Total of Both Approaches (VPH) = **1941**

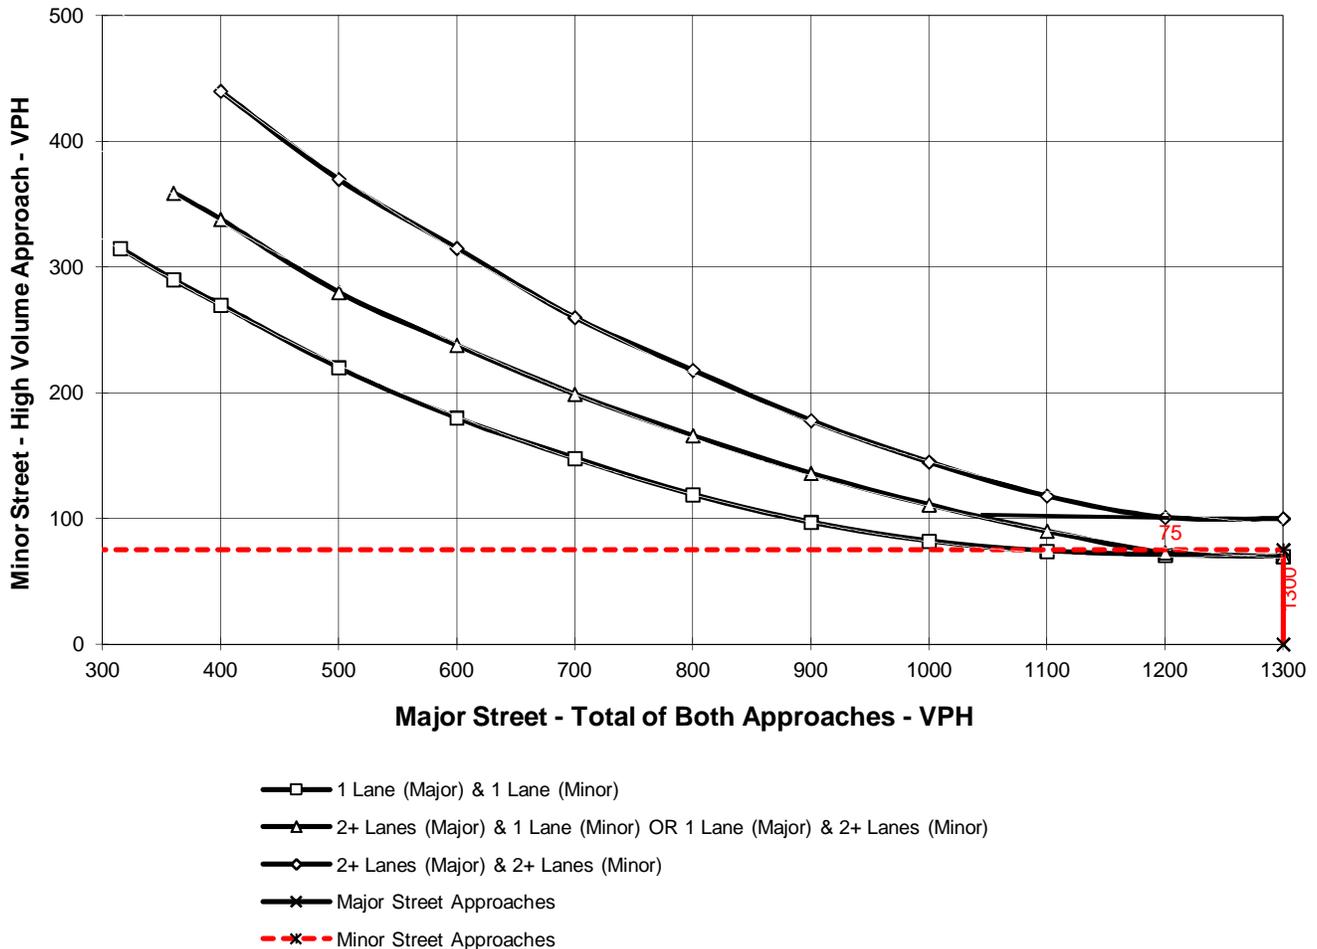

Number of Approach Lanes Major Street = **2**

Minor Street Name = **Park Center North**

High Volume Approach (VPH) = **75**

Number of Approach Lanes Minor Street = **1**

### WARRANTED FOR A SIGNAL

**\*\* NOTE:**

100 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACH WITH TWO OR MORE LANES AND 75 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACHING WITH ONE LANE.

Mr. Jackson Smith  
NEWCASTLE PARTNERS, INC.  
4740 Green River Road, Suite 118  
Corona, CA 92880

Dear Mr. Smith:

## INTRODUCTION

The firm of Kunzman Associates, Inc. is pleased to provide this traffic impact analysis addendum for the Waterman Industrial Center in the City of San Bernardino. This addendum is for a revised site plan that includes an additional right turns in/out only driveway on Waterman Avenue from the previous Waterman Industrial Center Traffic Impact Analysis prepared by Kunzman Associates, Inc. (September 9, 2015).

Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with those terms unique to transportation engineering, a glossary of terms is provided within Appendix A.

## PROJECT DESCRIPTION

The proposed development is located on the southwest corner of the Waterman Avenue at Dumas Street intersection in the City of San Bernardino. A vicinity map showing the project location is provided on Figure 1. The approximately 25 acre project site is proposed to be developed with 564,652 square feet of high-cube warehouse distribution center. The proposed project will have access to Waterman Avenue and Dumas Street. Figure 2 illustrates the project site plan.

## PROJECT TRIP DISTRIBUTION

Figures 3 and 4 contain the directional distributions of the project trips for the proposed land use. To determine the trip distributions for the proposed project, peak hour traffic counts of the existing directional distribution of traffic for existing areas in the vicinity of the site, and other additional information on future development and traffic impacts in the area were reviewed.

## FUTURE CONDITIONS

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions (see Appendix B), except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Mr. Jackson Smith  
NEWCASTLE PARTNERS, INC.  
September 28, 2015

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, with improvements (see Table 1).

As shown in Table 2 for Existing Plus Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions (see Appendix B), except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, with improvements (see Table 3).

As shown in Table 4 for Opening Year (2017) With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions (see Appendix B), except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, with improvements (see Table 5).

As shown in Table 6 for Year 2035 With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

Mr. Jackson Smith

## **FUTURE TRAFFIC SIGNAL WARRANT ANALYSIS**

For Existing Plus Ambient Growth traffic conditions, a traffic signal is projected to be warranted at the following study area intersection (see Appendix C):

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (2014 Update).

## **RECOMMENDATIONS**

The recommendations in this section address on-site improvements, off-site improvements and the phasing (as needed) of all necessary study area transportation improvements.

### **1. On-Site Improvements**

On-site improvements and improvements adjacent to the site will be required in conjunction with the proposed development to ensure adequate circulation within the project itself (see Figure 5).

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development, as necessary.

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development, as necessary.

Install traffic signal at Waterman Avenue and Park Center Circle North including Waterman Avenue northbound left turn lane improvements. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

Mr. Jackson Smith  
NEWCASTLE PARTNERS, INC.  
September 28, 2015

**2. Off-Site Improvements**

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

It has been a pleasure to service your needs on this project. Should you have any questions or if we can be of further assistance, please do not hesitate to call at (714) 973-8383.

Sincerely,

KUNZMAN ASSOCIATES, INC.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = defacto Right Turn; ^ = Mult-directional Lane; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

**Table 2**

**Existing Plus Project Traffic Contribution**

| Waterman Avenue (NS) at:<br>Project South Access (EW) - #10 | City of SB   | CSS                          | Morning   | 0.0      | 0.0              | N/A              | 11.4                  | B                | N/A              | N/A            | No                                 |
|   |              |                              | Evening   | 0.0      | 0.0              | N/A              | 13.1                  | B                | N/A              | N/A            | No                                 |

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = defacto Right Turn; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>5</sup> 99.9 - F = Delay high, intersection unstable, Level of Service F.

**Table 4**

**Opening Year (2017) With Project Traffic Contribution**

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

Table 5

Year 2035 With Project Intersection Delay and Level of Service

| Intersection   | Jurisdiction | Traffic Control <sup>2</sup> | Intersection Approach Lanes <sup>1</sup> |     |            |            |     |          |            |            |          |           |     |    | Peak Hour          |                  |                  |                    |                  |                  |

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = defacto Right Turn; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

**Table 6**

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

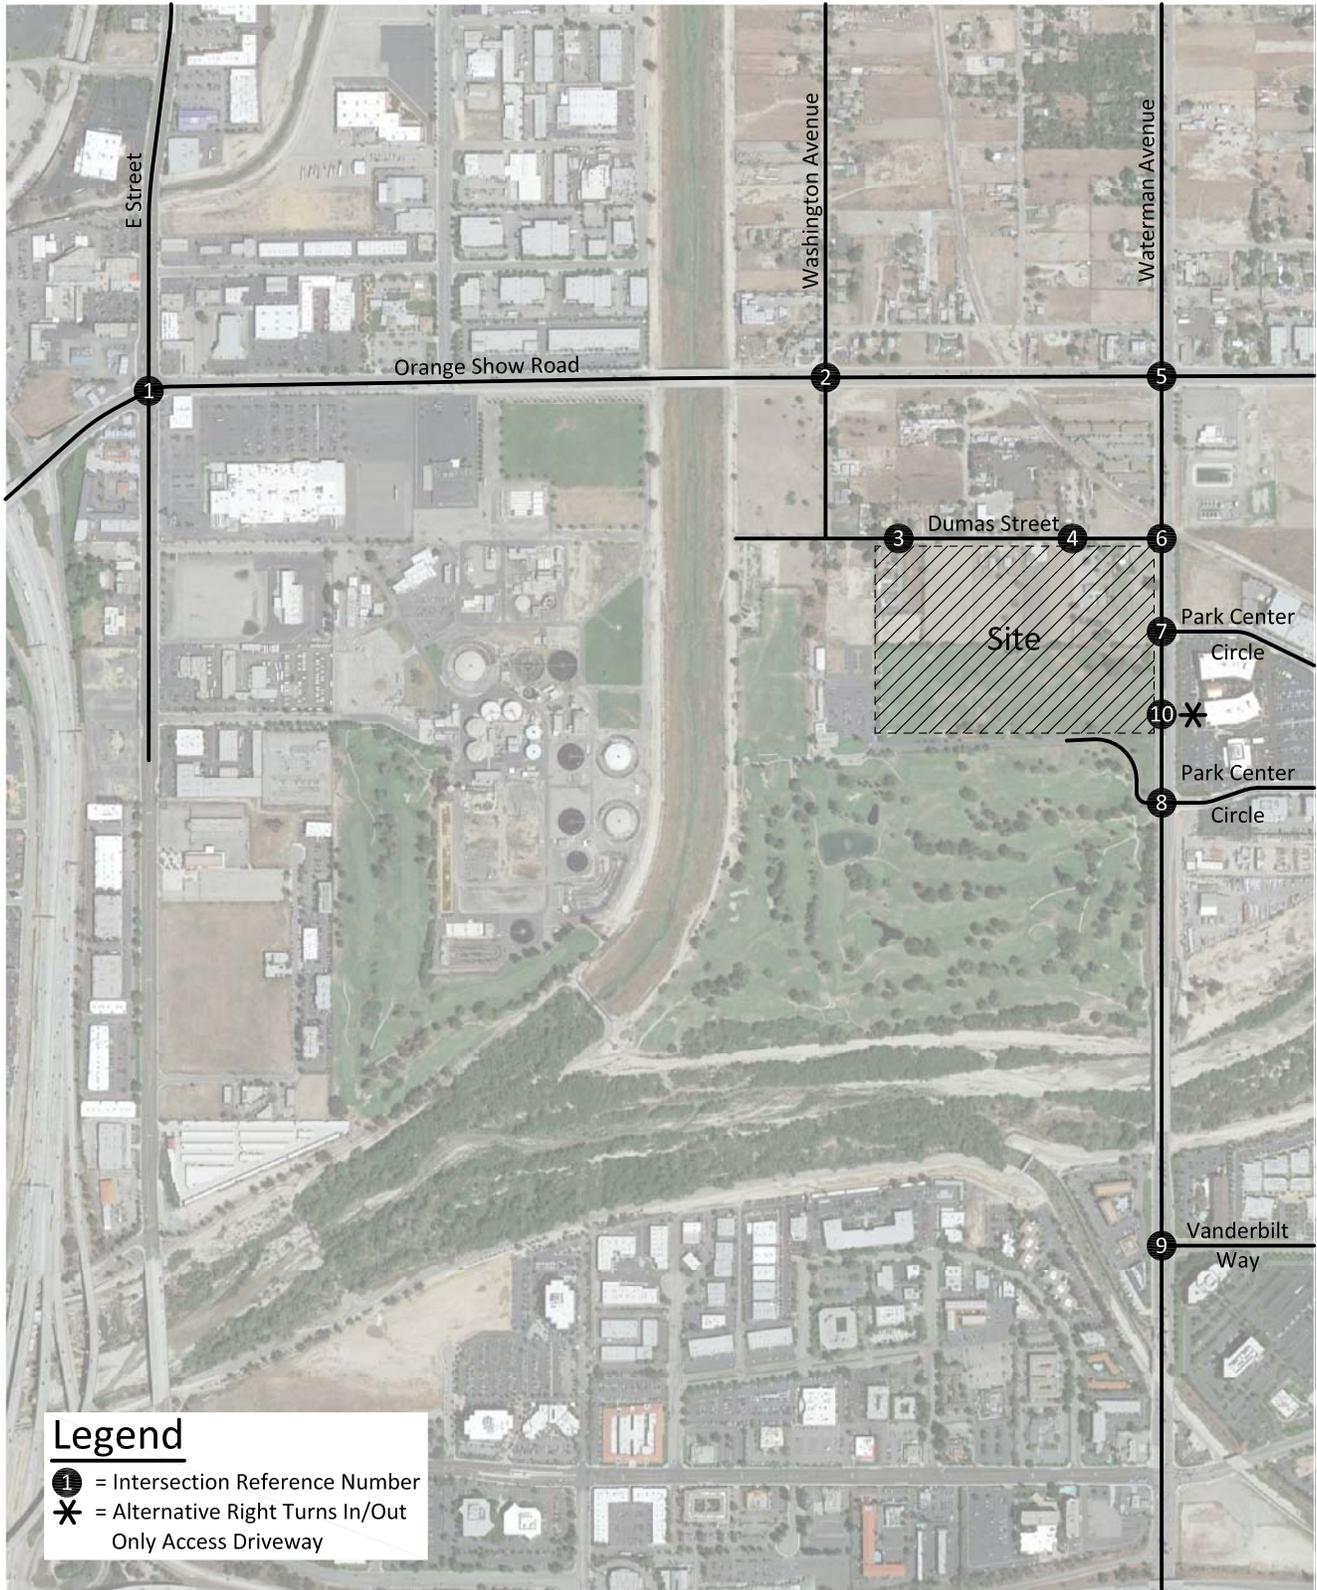

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

# Figure 5 Circulation Recommendations

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including eastbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

Install traffic signal at Waterman Avenue and Park Center Circle North. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including northbound left turn lane and southbound right turn lanes, landscaping and parkway improvements in conjunction with development, as necessary.

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

| VMT:      | Vehicle Miles Traveled                  |

### TERMS

**AVERAGE DAILY TRAFFIC:** The total volume during a year divided by the number of days in a year. Usually only weekdays are included.

**BANDWIDTH:** The number of seconds of green time available for through traffic in a signal progression.

**BOTTLENECK:** A constriction along a travelway that limits the amount of traffic that can proceed downstream from its location.

**CAPACITY:** The maximum number of vehicles that can be reasonably expected to pass over a given section of a lane or a roadway in a given time period.

**CHANNELIZATION:** The separation or regulation of conflicting traffic movements into definite paths of travel by the use of pavement markings, raised islands, or other suitable means to facilitate the safe and orderly movements of both vehicles and pedestrians.

**CLEARANCE INTERVAL:** Nearly same as yellow time. If there is an all red interval after the end of a yellow, then that is also added into the clearance interval.

**CORDON:** An imaginary line around an area across which vehicles, persons, or other items are counted (in and out).

**CYCLE LENGTH:** The time period in seconds required for one complete signal cycle.

**CUL-DE-SAC STREET:** A local street open at one end only, and with special provisions for turning around.

**DAILY CAPACITY:** The daily volume of traffic that will result in a volume during the peak hour equal to the capacity of the roadway.

**DELAY:** The time consumed while traffic is impeded in its movement by some element over which it has no control, usually expressed in seconds per vehicle.

**DEMAND RESPONSIVE SIGNAL:** Same as traffic-actuated signal.

**DENSITY:** The number of vehicles occupying in a unit length of the through traffic lanes of a roadway at any given instant. Usually expressed in vehicles per mile.

**DETECTOR:** A device that responds to a physical stimulus and transmits a resulting impulse to the signal controller.

**DESIGN SPEED:** A speed selected for purposes of design. Features of a highway, such as curvature, superelevation, and sight distance (upon which the safe operation of vehicles is dependent) are correlated to design speed.

**DIRECTIONAL SPLIT:** The percent of traffic in the peak direction at any point in time.

**DIVERSION:** The rerouting of peak hour traffic to avoid congestion.

**FORCED FLOW:** Opposite of free flow.

**FREE FLOW:** Volumes are well below capacity. Vehicles can maneuver freely and travel is unimpeded by other traffic.

**GAP:** Time or distance between successive vehicles in a traffic stream, rear bumper to front bumper.

**HEADWAY:** Time or distance spacing between successive vehicles in a traffic stream, front bumper to front bumper.

**INTERCONNECTED SIGNAL SYSTEM:** A number of intersections that are connected to achieve signal progression.

**LEVEL OF SERVICE:** A qualitative measure of a number of factors, which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operating costs.

**LOOP DETECTOR:** A vehicle detector consisting of a loop of wire embedded in the roadway, energized by alternating current and producing an output circuit closure when passed over by a vehicle.

**MINIMUM ACCEPTABLE GAP:** Smallest time headway between successive vehicles in a traffic stream into which another vehicle is willing and able to cross or merge.

**MULTI-MODAL:** More than one mode; such as automobile, bus transit, rail rapid transit, and bicycle transportation modes.

**OFFSET:** The time interval in seconds between the beginning of green at one intersection and the beginning of green at an adjacent intersection.

**PLATOON:** A closely grouped component of traffic that is composed of several vehicles moving, or standing ready to move, with clear spaces ahead and behind.

**ORIGIN-DESTINATION SURVEY:** A survey to determine the point of origin and the point of destination for a given vehicle trip.

**PASSENGER CAR EQUIVALENTS:** One car is one Passenger Car Equivalent. A truck is equal to 2 or 3 Passenger Car Equivalents in that a truck requires longer to start, goes slower, and accelerates slower. Loaded trucks have a higher Passenger Car Equivalent than empty trucks.

**PEAK HOUR:** The 60 consecutive minutes with the highest number of vehicles.

**PRETIMED SIGNAL:** A type of traffic signal that directs traffic to stop and go on a predetermined time schedule without regard to traffic conditions. Also, fixed time signal.

**PROGRESSION:** A term used to describe the progressive movement of traffic through several signalized intersections.

**SCREEN-LINE:** An imaginary line or physical feature across which all trips are counted, normally to verify the validity of mathematical traffic models.

**SIGNAL CYCLE:** The time period in seconds required for one complete sequence of signal indications.

**SIGNAL PHASE:** The part of the signal cycle allocated to one or more traffic movements.

**STARTING DELAY:** The delay experienced in initiating the movement of queued traffic from a stop to an average running speed through a signalized intersection.

**TRAFFIC-ACTUATED SIGNAL:** A type of traffic signal that directs traffic to stop and go in accordance with the demands of traffic, as registered by the actuation of detectors.

**TRIP:** The movement of a person or vehicle from one location (origin) to another (destination). For example, from home to store to home is two trips, not one.

**TRIP-END:** One end of a trip at either the origin or destination; i.e. each trip has two trip-ends. A trip-end occurs when a person, object, or message is transferred to or from a vehicle.

**TRIP GENERATION RATE:** The quantity of trips produced and/or attracted by a specific land use stated in terms of units such as per dwelling, per acre, and per 1,000 square feet of floor space.

**TRUCK:** A vehicle having dual tires on one or more axles, or having more than two axles.

**UNBALANCED FLOW:** Heavier traffic flow in one direction than the other. On a daily basis, most facilities have balanced flow. During the peak hours, flow is seldom balanced in an urban area.

**VEHICLE MILES OF TRAVEL:** A measure of the amount of usage of a section of highway, obtained by multiplying the average daily traffic by length of facility in miles.

**APPENDIX B**

**Explanation and Calculation of Intersection Delay**

## **EXPLANATION AND CALCULATION OF INTERSECTION LEVEL OF SERVICE USING DELAY METHODOLOGY**

The levels of service at the unsignalized and signalized intersections are calculated using the delay methodology in the Highway Capacity Manual. This methodology views an intersection as consisting of several lane groups. A lane group is a set of lanes serving a movement. If there are two northbound left turn lanes, then the lane group serving the northbound left turn movement has two lanes. Similarly, there may be three lanes in the lane group serving the northbound through movement, one lane in the lane group serving the northbound right turn movement, and so forth. It is also possible for one lane to serve two lane groups. A shared lane might result in there being 1.5 lanes in the northbound left turn lane group and 2.5 lanes in the northbound through lane group.

For each lane group, there is a capacity. That capacity is calculated by multiplying the number of lanes in the lane group times a theoretical maximum lane capacity per lane time's 12 adjustment factors.

Each of the 12 adjustment factors has a value of approximately 1.00. A value less than 1.00 is generally assigned when a less than desirable condition occurs.

The 12 adjustment factors are as follows:

1. Peak hour factor (to account for peaking within the peak hour)
2. Lane utilization factor (to account for not all lanes loading equally)
3. Lane width
4. Percent of heavy trucks
5. Approach grade
6. Parking
7. Bus stops at intersections
8. Area type (CBD or other)
9. Right turns
10. Left turns

11. Pedestrian activity
12. Signal progression

The maximum theoretical lane capacity and the 12 adjustment factors for it are all unknowns for which approximate estimates have been recommended in the Highway Capacity Manual. For the most part, the recommended values are not based on statistical analysis but rather on educated estimates. However, it is possible to use the delay method and get reasonable results as will be discussed below.

Once the lane group volume is known and the lane group capacity is known, a volume to capacity ratio can be calculated for the lane group.

With a volume to capacity ratio calculated, average delay per vehicle in a lane group can be estimated. The average delay per vehicle in a lane group is calculated using a complex formula provided by the Highway Capacity Manual, which can be simplified and described as follows:

Delay per vehicle in a lane group is a function of the following:

1. Cycle length
2. Amount of red time faced by a lane group
3. Amount of yellow time for that lane group
4. The volume to capacity ratio of the lane group

The average delay per vehicle for each lane group is calculated, and eventually an overall average delay for all vehicles entering the intersection is calculated. This average delay per vehicle is then used to judge Level of Service. The Level of Services are defined in the table that follows this discussion.

Experience has shown that when a maximum lane capacity of 1,900 vehicles per hour is used (as recommended in the Highway Capacity Manual), little or no yellow time penalty is used, and none of the 12 penalty factors are applied, calculated delay is realistic. The delay calculation for instance assumes that yellow time is totally unused. Yet experience shows that most of the yellow time is used.

An idiosyncrasy of the delay methodology is that it is possible to add traffic to an intersection and reduce the average total delay per vehicle. If the average total delay is 30 seconds per vehicle for all vehicles traveling through an intersection, and traffic is

added to a movement that has an average total delay of 15 seconds per vehicle, then the overall average total delay is reduced.

The delay calculation for a lane group is based on a concept that the delay is a function of the amount of unused capacity available. As the volume approaches capacity and there is no more unused capacity available, then the delay rapidly increases. Delay is not proportional to volume, but rather increases rapidly as the unused capacity approaches zero.

Because delay is not linearly related to volumes, the delay does not reflect how close an intersection is to overloading. If an intersection is operating at Level of Service C and has an average total delay of 18 seconds per vehicle, you know very little as to what percent the traffic can increase before Level of Service E is reached.

## LEVEL OF SERVICE DESCRIPTION<sup>1</sup>

| Level Of Service | Description  | Average Total Delay Per Vehicle (Seconds) |                |
|------------------|--|---|----------------|
|                  |  | Signalized                                | Unsignalized   |
| A                | Level of Service A occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.   | 0 to 10.00                                | 0 to 10.00     |
| B                | Level of Service B generally occurs with good progression and/or short cycle lengths. More vehicles stop than for Level of Service A, causing higher levels of average total delay.  | 10.01 to 20.00                            | 10.01 to 15.00 |
| C                | Level of Service C generally results when there is fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.  | 20.01 to 35.00                            | 15.01 to 25.00 |
| D                | Level of Service D generally results in noticeable congestion. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume to capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.   | 35.01 to 55.00                            | 25.01 to 35.00 |
| E                | Level of Service E is considered to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high volume to capacity ratios. Individual cycle failures are frequent occurrences.   | 55.01 to 80.00                            | 35.01 to 50.00 |
| F                | Level of Service F is considered to be unacceptable to most drivers. This condition often occurs with oversaturation, i.e., when arrival flow rates exceed the capacity of the intersection. It may also occur at high volume to capacity ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels. | 80.01 and up                              | 50.01 and up   |

**APPENDIX C**

**Traffic Signal Warrant Worksheet**

# PEAK HOUR VOLUME WARRANT (Rural Areas)

## Existing + Ambient Growth

Major Street Name = **Waterman Avenue**

Total of Both Approaches (VPH) = **1941**

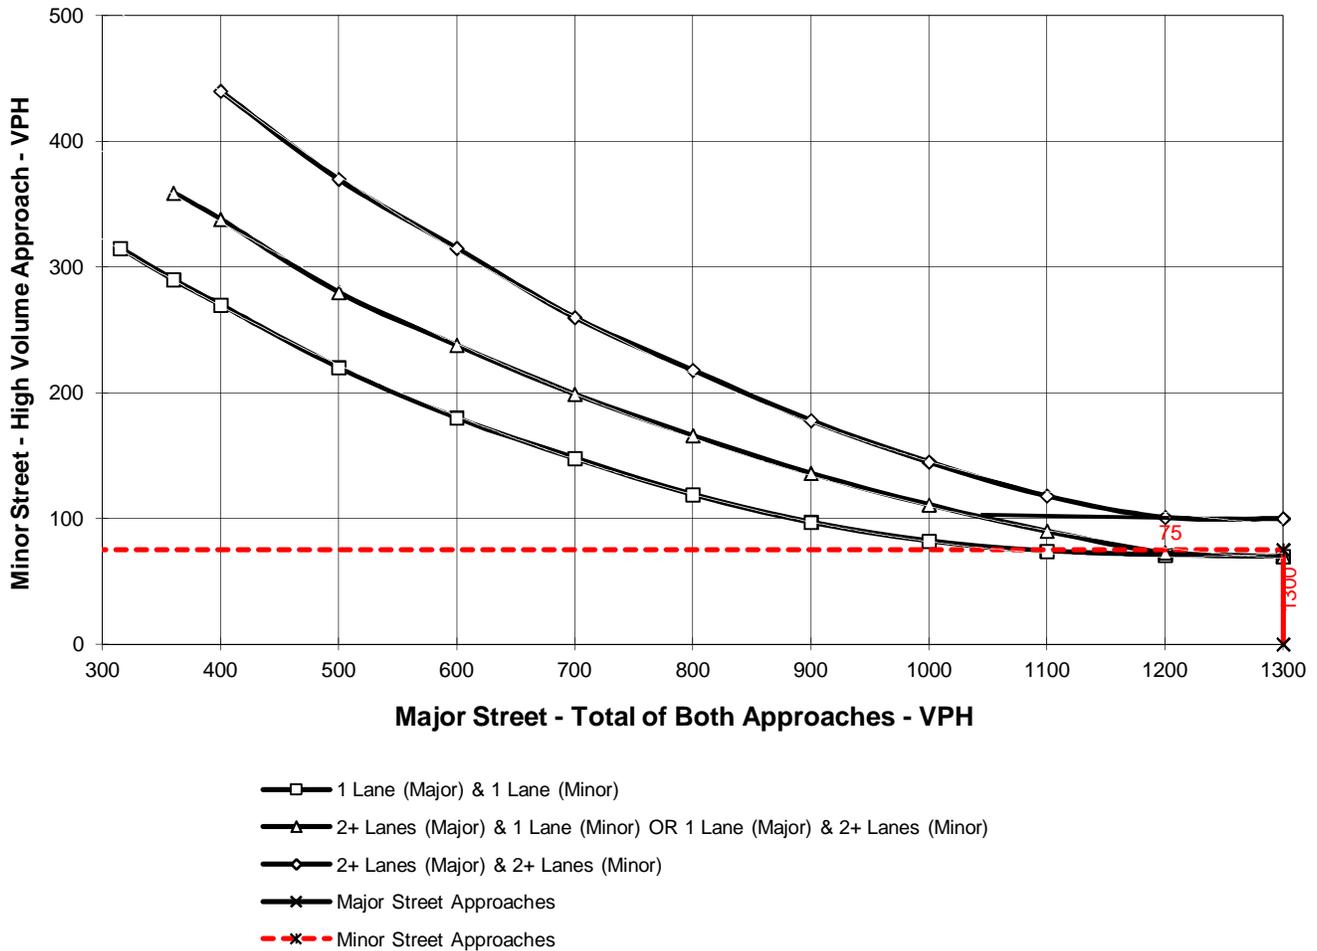

Number of Approach Lanes Major Street = **2**

Minor Street Name = **Park Center North**

High Volume Approach (VPH) = **75**

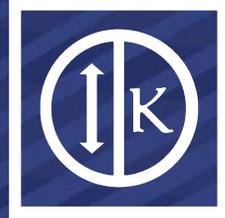

Number of Approach Lanes Minor Street = **1**

### WARRANTED FOR A SIGNAL

**\*\* NOTE:**

100 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACH WITH TWO OR MORE LANES AND 75 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACHING WITH ONE LANE.

## I. Executive Summary

---

The purpose of this report is to provide an assessment of the traffic impacts resulting from the development of the proposed Waterman Industrial Center project, and to identify the traffic mitigation measures necessary to maintain the established level of service standard for the elements of the impacted roadway system. The traffic issues related to the proposed land use and development have been evaluated in the context of the California Environmental Quality Act.

The City of San Bernardino is the lead agency responsible for preparation of the traffic impact analysis, in accordance with California Environmental Quality Act authorizing legislation. This report analyzes traffic impacts for the Existing Plus Project, the anticipated opening date with full occupancy of the development in Year 2017 at which time it will be generating trips at its full potential, and for the Year 2035.

Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with those terms unique to transportation engineering, a glossary of terms is provided in Appendix A.

### A. Analysis Methodology

A series of scoping discussions were conducted with the City of San Bernardino to define the desired analysis locations for each future analysis year. The project scoping agreement with the City of San Bernardino is included in Appendix B.

The analysis of the traffic impacts from the proposed development and the assessment of the required mitigation measures were based on an evaluation of the existing and forecast traffic conditions in the vicinity of the site with and without the project. The following analysis years are considered in this report:

- Existing Conditions (2015)
- Existing Plus Project<sup>1</sup> Conditions
- Existing Plus Ambient Growth (2017)                      Baseline Without Other Projects
- Opening Year (2017) Without Project                      With Cumulative Projects
- Opening Year (2017) With Project                      With Cumulative Projects
- Horizon Year Conditions (2035) Without Project
- Horizon Year Conditions (2035) With Project

The roadway elements that must be analyzed are dependent on both the analysis year (project Opening Year or Year 2035) and project generated trips. The identification of the study area, and the intersections and highway segments requiring analysis, was based on an estimate of the two-way traffic volumes on the roadway segments near the project site. All arterial segments have been included in the analysis when the anticipated project volume

---

<sup>1</sup> The existing plus project conditions has been analyzed to comply with the Sunnyvale West Neighborhood Association v. City of Sunnyvale CEQA court case. This scenario assumes the full development of the proposed project and full absorption of the proposed project trips on the circulation system at the present time. This scenario is provided for informational purposes only, and will not be used for impact determinations or mitigation.

equals or exceeds 50 two-way trips in the peak hours. The requirement is 100 two-way peak hour trips for freeways.

The project does not contribute trips greater than the freeway threshold volume of 100 two-way peak hour trips. The project does not contribute trips greater than the arterial link threshold volume of 50 two-way trips in the peak hours on intersections outside the City of San Bernardino.

**B. Definition of Deficiency and Significant Impact**

The following definitions of deficiencies and significant impacts have been developed in accordance with the City of San Bernardino requirements.

1. Definition of Deficiency

The definition of an intersection deficiency has been obtained from the City of San Bernardino General Plan. The General Plan states that peak hour intersection operations of Level of Service D or better are generally acceptable. Therefore, any intersection operating Level of Service E to F will be considered deficient.

For freeway facilities, the definition of deficiency is based on maintaining a level of service standard of Level of Service E or better, except where an existing Level of Service F condition is identified. A deficiency is, therefore, defined as any freeway segment operating or projected to operate at Level of Service F, unless the segment is currently identified.

2. Definition of Significant Impact

Based on the City of San Bernardino Development Services Department, Traffic Impact Study Guidelines (2015), the impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |                 |                      |
|--|-----------------|----------------------|
| Level of Service                               | Volume/Capacity | Incremental Increase |
| C  | 0.71-0.80       | 0.04 or more         |
| D  | 0.81-0.90       | 0.02 or more         |
| E/F  | 0.91 - more     | 0.01 or more         |

An intersection mitigation measure shall either fix the deficiency, or reduce the volume to capacity ratio so that it is below the level that occurs without the project.

A traffic impact is considered significant if the project both: i) contributes measurable traffic to and ii) substantially and adversely changes the level of service at any off-site location projected to experience deficient operations under foreseeable cumulative conditions, where feasible improvements consistent with the City of San Bernardino General Plan cannot be constructed.

**C. Project Description**

The proposed development is located on the southwest corner of the Waterman Avenue at Dumas Street intersection in the City of San Bernardino. A vicinity map showing the project location is provided on Figure 1.

The approximately 25 acre project site is proposed to be developed with 564,652 square feet of high-cube warehouse distribution center. The proposed project will have access to Waterman Avenue and Dumas Street. Figure 2 illustrates the project site plan.

**D. Existing Conditions**

The study area intersections currently operate at an acceptable Level of Service during the peak hours for existing traffic conditions.

**E. Project Traffic**

Project traffic volumes for all future projections were estimated using the manual approach. Trip generation has been estimated based on the Institute of Transportation Engineers, Trip Generation, 9th Edition, 2012 and City of Fontana, Truck Trip Generation Study, August 2003.

The proposed development is projected to generate approximately 1,282 daily vehicle trips in Passenger Car Equivalents, 87 Passenger Car Equivalents of which will occur during the morning peak hour and 95 Passenger Car Equivalents of which will occur during the evening peak hour.

To determine the trip distributions for the proposed project, peak hour traffic counts of the existing directional distribution of traffic for existing areas in the vicinity of the site, and other additional information on future development and traffic impacts in the area were reviewed.

**F. Future Conditions**

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, with improvements (see Table 4).

As shown in Table 5 for Existing Plus Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Ambient Growth traffic conditions without and with improvements (see Table 6).

For Existing Plus Ambient Growth traffic conditions, a traffic signal is projected to be warranted at the following study area intersection (see Appendix G):

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (2014 Edition).

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) Without Project traffic conditions without and with improvements (see Table 7).

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, with improvements (see Table 8).

As shown in Table 9 for Opening Year (2017) With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 Without Project traffic conditions without and with improvements (see Table 10).

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, except for the following

intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, with improvements (see Table 11).

As shown in Table 12 for Year 2035 With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

## **G. Recommendations**

The recommendations in this section address on-site improvements, off-site improvements and the phasing (as needed) of all necessary study area transportation improvements.

### **1. On-Site Improvements**

On-site improvements and improvements adjacent to the site will be required in conjunction with the proposed development to ensure adequate circulation within the project itself (see Figure 40).

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development, as necessary.

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development, as necessary.

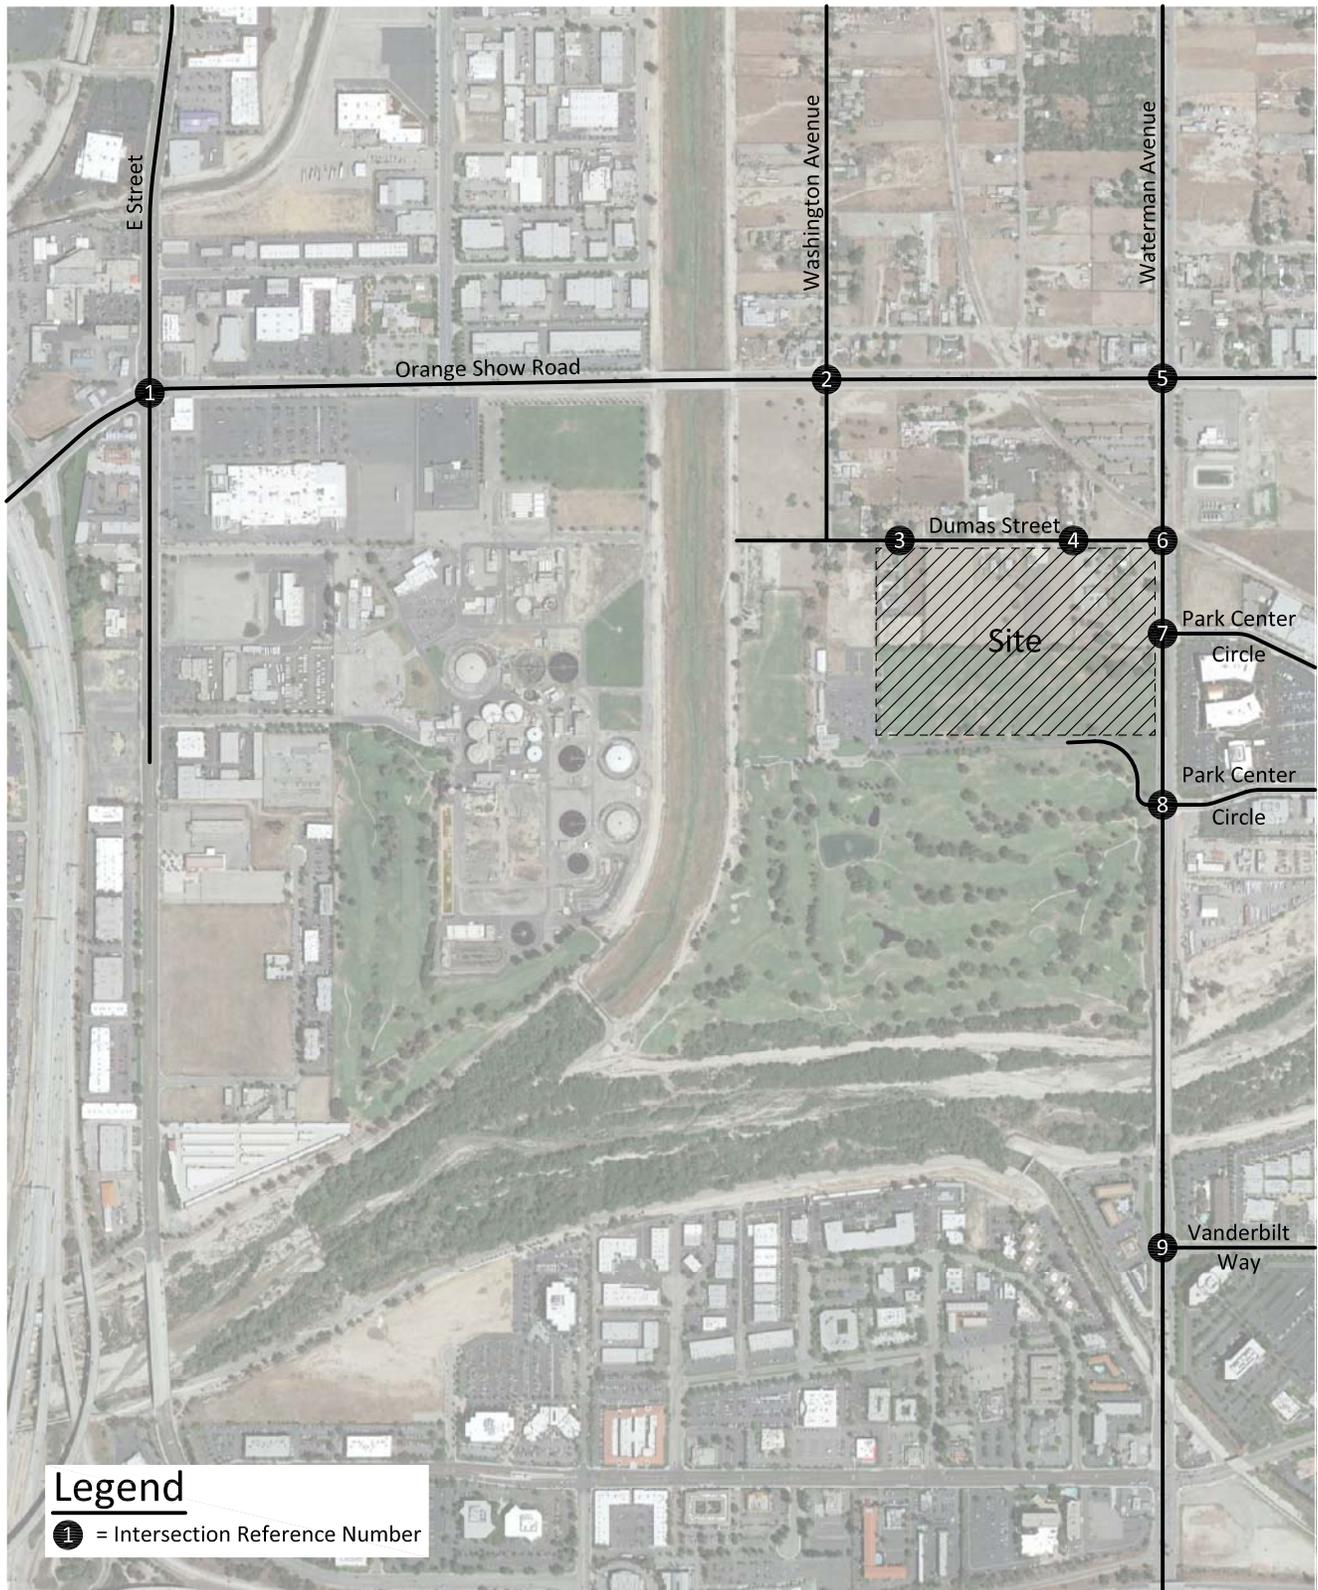

Install traffic signal at Waterman Avenue and Park Center Circle North including Waterman Avenue northbound left turn lane improvements. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

2. Off-Site Improvements

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

Figure 2  
Site Plan

## II. Existing Conditions

---

### A. Existing Roadway System

Figure 3 identifies the existing conditions for study area roadways. The number of through lanes for existing roadways and the existing intersection controls are identified.

Local access is provided by various roadways in the vicinity of the site. The east-west roadways which will be most affected by the project include Orange Show Road, Dumas Street, Park Center Circle, and Vanderbilt Way. North-south roadways expected to provide local access include E Street, Washington Avenue, and Waterman Avenue.

### B. Existing Volumes

Figure 4 depicts the existing average daily traffic volumes. The existing average daily traffic volumes were factored from peak hour counts in Passenger Car Equivalent's (see Appendix C) obtained by Kunzman Associates, Inc. using the following formula for each intersection leg:

$$\text{PM Peak Hour (Approach + Exit Volume)} \times 11.5 = \text{Daily Leg Volume.}$$

This is a conservative estimate and may overestimate the average daily traffic volumes.

Existing intersection traffic conditions were established through morning and evening peak hour traffic counts obtained by Kunzman Associates, Inc. from August 2015 (see Appendix C). In addition, truck classification counts were conducted at the study area intersections. The existing volumes and types (number of axles) of trucks was used in the conversion of trucks to Passenger Car Equivalent's. The truck trips were converted using the following factors: 2 axle trucks = 2.0, 3 axle trucks = 2.5, and 4+ axle trucks = 3.0. The resulting Passenger Car Equivalents are shown on Figures 5 and 6, respectively. Explicit peak hour factors have been calculated using the data collected for this effort as well. The morning and evening peak hour traffic volumes were identified by counting the two-hour periods from 7:00 AM – 9:00 AM and 4:00 PM – 6:00 PM.

### C. Existing Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix F) based on the Highway Capacity Manual – Transportation Research Board Special Report 209. To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection. The signalized intersections are considered deficient (Level of Service F) if the overall intersection critical volume to capacity ratio equals or exceeds 1.0, even if the level of service defined by the delay value is below the defined Level of Service standard. The volume to capacity ratio is defined as the critical volumes divided by the intersection capacity. A volume to capacity ratio greater than 1.0 implies an infinite queue.

The Level of Service analysis for signalized intersections has been performed using optimized signal timing. This analysis has included an assumed lost time of two seconds per phase. Signal timing optimization has considered pedestrian safety and signal coordination requirements. Appropriate time for pedestrian crossings has also been considered in the signalized intersection analysis. The following formula has been used to calculate the pedestrian minimum times for all Highway Capacity Manual runs:

$$(\text{Curb to curb distance}) / (3.5 \text{ feet/second}) + 7 \text{ seconds.}$$

For existing/Existing Plus Project/and Opening Year traffic conditions, saturation flow rates of 1,800 vehicles per hour of green for through and right turn lanes and 1,700 vehicles per lane for single left turn lanes, 1,600 vehicles per lane for dual left turn lanes and 1,500 vehicles per lane for triple left turn lanes have been assumed for the capacity analysis.

For Year 2035 traffic conditions, saturation flow rates of 1,900 vehicles per hour of green for through and right turn lanes and 1,800 vehicles per lane for single left turn lanes, 1,700 vehicles per lane for dual left turn lanes and 1,800 vehicles per lane for double right turn lanes have been assumed for the capacity analysis.

The peak hour traffic volumes have been adjusted to peak 15 minute volumes for analysis purposes using the existing observed peak 15 minute to peak hour factors (see Appendix C). The Year 2035 peak hour factor has been adjusted to 0.95. This is to account for the effects of congestion on peak spreading. Peak spreading refers to the tendency of traffic to spread more evenly across time as congestion increases.

The existing delay and Level of Service for intersections in the vicinity of the project are shown in Table 1. The study area intersections currently operate at an acceptable Level of Service during the peak hours for existing traffic conditions. Existing delay worksheets are provided in Appendix F.

**D. Planned Transportation Improvements and Relationship to General Plan**

The City of San Bernardino General Plan Circulation Element is shown on Figure 7. Both existing and future roadways are included in the Circulation Element of the General Plan and are graphically depicted on Figure 7. This figure shows the nature and extent of arterial highways that are needed to adequately serve the ultimate development depicted by the land use element of the General Plan. The City of San Bernardino General Plan roadway cross-sections are illustrated on Figure 8.

**E. Transit Service**

Figure 9 depicts the San Bernardino Bus Transit System Map. Transit service is provided by Omnitrans. Transit Route 5 operates on Waterman Avenue, and Transit Routes 2 and 15 operate on E Street.

**F. Bicycle and Pedestrian Facilities**

The City of San Bernardino designated bike paths are illustrated on Figure 10 and the existing pedestrian facilities adjacent to the project are shown in Figure 11.

**Table 1**

| Park Center Circle S (EW) - #8                           | City of SB   | TS                           | 1  | 2   | 1   | 1          | 2   | d   | 0.5       | 0.5 | d   | 0.5       | 0.5 | d  | 11.6               | B                | 0.763            | 13.6               | B                | 0.926            |
| Vanderbilt Way (EW) - #9                                 | City of SB   | TS                           | 1  | 2   | 1   | 1          | 2.5 | 0.5 | 0         | 1   | 0   | 1.5       | 0.5 | 1  | 22.0               | C                | 0.577            | 18.6               | B                | 0.434            |

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = De facto Right Turn.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

### III. Project Trips

---

#### A. Project Description

The approximately 25 acre project site is proposed to be developed with 564,652 square feet of high-cube warehouse distribution center. The proposed project will have access to Waterman Avenue and Dumas Street.

#### B. Trip Generation

The trips generated by the project are determined by multiplying an appropriate trip generation rate by the quantity of land use. Trip generation rates are predicated on the assumption that energy costs, the availability of roadway capacity, the availability of vehicles to drive, and life styles remain similar to what are known today. A major change in these variables may affect trip generation rates.

Trip generation rates were determined for daily traffic and morning peak hour inbound and outbound traffic, and evening peak hour inbound and outbound traffic for the proposed land use. By multiplying the trip generation rates by the land use quantity, the traffic volumes are determined. Table 2 shows the project trip generation based upon rates obtained from the Institute of Transportation Engineers, Trip Generation, 9th Edition, 2012 and City of Fontana, Truck Trip Generation Study, August 2003.

The proposed development is projected to generate approximately 1,282 daily vehicle trips in Passenger Car Equivalents, 87 Passenger Car Equivalents of which will occur during the morning peak hour and 95 Passenger Car Equivalents of which will occur during the evening peak hour.

#### C. Trip Distribution

Figures 12 and 13 contain the directional distributions of the project trips for the proposed land use. To determine the trip distributions for the proposed project, peak hour traffic counts of the existing directional distribution of traffic for existing areas in the vicinity of the site, and other additional information on future development and traffic impacts in the area were reviewed.

#### D. Trip Assignment

Based on the identified trip generation and distributions, project average daily traffic volumes have been calculated and shown on Figure 14. Morning and evening peak hour intersection turning movement volumes expected from the project are shown on Figures 15 and 16, respectively.

**E. Traffic Contribution Test**

No analysis is required further than 5 miles from the project site. The roadway elements that must be analyzed are dependent on both the analysis year (project Opening Year or Year 2035) and project generated trips. The identification of the study area, and the intersections and highway segments requiring analysis, was based on an estimate of the two-way traffic volumes on the roadway segments near the project site. All arterial segments have been included in the analysis when the anticipated project volume equals or exceeds 50 two-way trips in the peak hours. The requirement is 100 two-way peak hour trips for freeways. Figure 17 graphically depicts the project traffic contribution test volumes on all of the roadway segments adjacent to the potential intersection analysis locations until the project volume contribution has clearly dropped below the 50 trip threshold.

The project does not contribute trips greater than the freeway threshold volume of 100 two-way peak hour trips. The project does not contribute trips greater than the arterial link threshold volume of 50 two-way trips in the peak hours on intersections outside of the City of San Bernardino.

## IV. Future Conditions

---

---

To assess future traffic conditions, existing traffic is combined with ambient growth, other development, and project traffic. The opening year for analysis purposes in this report is 2017. The horizon year is 2035.

### A. Method of Projection

#### 1. Ambient Growth Opening Year

To account for ambient growth on roadways, Opening Year (2017) traffic volumes have been interpolated from the Year 2035 traffic volumes based upon a proportion of the future growth increment from the San Bernardino Transportation Analysis Model (SBTAM) traffic model Year 2008 and Year 2035 average daily traffic volume forecasts (see Appendix D). The SBTAM traffic model plots are included in Appendix E.

#### 2. Other Development

Potential developments within 1.5 mile radius of the study area are included in the analysis if they are not currently built, they are approved, their approval has not expired, and they would contribute trips to the study area intersections.

Table 4 lists the proposed land uses for the other developments (see Figure 18), and shows the daily and peak hour vehicle trips generated by the other development in the study area.

Based on the identified trip generation and distributions, other development average daily traffic volumes have been calculated and shown on Figure 19. Figures 20 and 21 shows the other development morning and evening peak hour intersection turning movement volumes, respectively.

#### 3. Opening Year Traffic Conditions

To assess Opening Year traffic conditions, existing traffic is combined with ambient growth, and other development traffic. The opening year for analysis purposes in this report is 2017.

#### 4. Horizon Year Traffic Conditions

The average daily traffic volume forecasts have been determined using the growth increment approach on the San Bernardino Transportation Analysis Model (SBTAM) traffic model Year 2008 and Year 2035 average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 27 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2015 and Year 2035. For this purpose, linear growth between the Year 2008 base condition and the forecast Year 2035 condition was

assumed. Since the increment between Year 2015 and Year 2035 is 20 years of the 27 year time frame, a factor of 0.74 (i.e., 20/27) was used.

The Year 2035 Without Project daily and peak hour directional roadway segment volume forecasts have been determined using the growth increment approach on the SBTAM traffic model Year 2008 and Year 2035 peak hour volumes. The SBTAM traffic model plots are included in Appendix E. Current peak hour intersection approach/departure data is a necessary input to this approach. The existing traffic count data serves as both the starting point for the refinement process, and also provides important insight into current travel patterns and the relationship between peak hour and daily traffic conditions. The initial turning movement proportions are estimated based upon the relationship of each approach leg's forecast traffic volume to the other legs forecast volumes at the intersection. The initial estimate of turning movement proportions is then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program Report 255. A linear programming algorithm is used to calculate individual turning movements that match the known directional roadway segment volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

Project traffic volumes were then added to the Year 2035 SBTAM traffic model volumes. Quality control checks and forecast adjustments were performed as necessary to ensure that all future traffic volume forecasts reflect a minimum of 10% growth over existing traffic volumes. The result of this traffic forecasting procedure is a series of traffic volumes suitable for traffic operations analysis.

## **B. Average Daily Traffic Volumes**

### **1. Existing Plus Project**

The average daily traffic volumes for Existing Plus Project traffic conditions have been determined. Existing Plus Project average daily traffic volumes are shown on Figure 22.

### **2. Existing Plus Ambient Growth**

The average daily traffic volumes for Existing Plus Ambient Growth traffic conditions have been determined as described above using the growth interpolation process (see Section IV.A). Existing Plus Ambient Growth average daily traffic volumes are shown on Figure 23.

### **3. Opening Year (2017) Without Project**

The average daily traffic volumes for Opening Year (2017) Without Project traffic conditions have been determined as described above using the growth interpolation process (see Section IV.A). Opening Year (2017) Without Project average daily traffic volumes are shown on Figure 24.

4. Opening Year (2017) With Project

The average daily traffic volumes for Opening Year (2017) With Project traffic conditions have been determined as described above using the volume addition process (see Section IV.A). Opening Year (2017) With Project average daily traffic volumes are shown on Figure 25.

5. Year 2035 Without Project

The average daily traffic volumes for Year 2035 Without Project traffic conditions have been determined as described above using the growth increment process (see Section IV.A). Year 2035 Without Project average daily traffic volumes are shown on Figure 26.

6. Year 2035 With Project

The average daily traffic volumes for Year 2035 With Project traffic conditions have been determined as described above using the volume addition process (see Section IV.A). Year 2035 With Project average daily traffic volumes are shown on Figure 27.

**C. Intersection Level of Service**

Level of Service calculation worksheets are provided in Appendix F for all traffic condition scenarios.

1. Existing Plus Project

The Existing Plus Project delay and Level of Service for the study area roadway network are shown in Table 4. Table 4 shows delay values based on the geometrics at the study area intersections, without and with improvements. Existing Plus Project morning and evening peak hour intersection turning movement volumes are shown on Figures 28 and 29, respectively.

As shown in Table 4, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, with improvements.

Table 5 depicts the Existing Plus Project trip contribution at the study area intersections. As shown in Table 5 for Existing Plus Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

2. Existing Plus Ambient Growth

The Existing Plus Ambient Growth (2017) delay and Level of Service for the study area roadway network without other development or the proposed project are shown in Table 6. Table 6 shows delay values based on the existing geometrics at the study area intersections. Existing Plus Ambient Growth morning and evening peak hour intersection turning movement volumes are shown on Figures 30 and 31, respectively.

As shown in Table 6, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Ambient Growth traffic conditions.

3. Opening Year (2017) Without Project

The Opening Year (2017) delay and Level of Service for the study area roadway network without the proposed project are shown in Table 7. Table 7 shows delay values based on the geometrics at the study area intersections, without and with improvements. Opening Year (2017) Without Project morning and evening peak hour intersection turning movement volumes are shown on Figures 32 and 33, respectively.

As shown in Table 7, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) Without Project traffic conditions without and with improvements.

4. Opening Year (2017) With Project

The Opening Year (2017) delay and Level of Service for the study area roadway network with the proposed project are shown in Table 8. Table 8 shows delay values based on the geometrics at the study area intersections, without and with improvements. Opening Year (2017) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 34 and 35, respectively.

As shown in Table 8, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, with improvements

Table 9 depicts the Opening Year (2017) With Project trip contribution at the study area intersections. As shown in Table 9 for Opening Year (2017) With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

5. Year 2035 Without Project

The Year 2035 delay and Level of Service for the study area roadway network without the proposed project are shown in Table 10. Table 10 shows delay values based on the geometrics at the study area intersections, without and with improvements. Year 2035 Without Project morning and evening peak hour intersection turning movement volumes are shown on Figures 36 and 37, respectively.

As shown in Table 10, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 Without Project traffic conditions without and with improvements.

6. Year 2035 With Project

The Year 2035 delay and Level of Service for the study area roadway network with the proposed project are shown in Table 11. Table 11 shows delay values based on the geometrics at the study area intersections, without and with improvements. Year 2035 With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 38 and 39, respectively.

As shown in Table 11, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, except for the intersection, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, with improvements.

Table 12 depicts the Year 2035 With Project trip contribution at the study area intersections. As shown in Table 12 for Year 2035 With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

**D. Future Traffic Signal Warrant Analysis**

For Existing Plus Ambient Growth traffic conditions, a traffic signal is projected to be warranted at the following study area intersection (see Appendix G):

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (2014 Edition).

**E. Freeway Evaluation**

The project does not contribute trips greater than the freeway threshold of 100 two-way trips.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = defacto Right Turn; ^ = Mult-directional Lane; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = defacto Right Turn; TS = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>5</sup> Traffic signal is projected to be warranted.

Table 7

Opening Year 2017 Without Project Intersection Delay and Level of Service

| Intersection   | Jurisdiction | Traffic Control <sup>2</sup> | Intersection Approach Lanes <sup>1</sup> |     |     |            |     |     |           |     |     |           |     |    | Peak Hour          |                  |                  |                    |                  |                  |

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = defacto Right Turn; ^ = Mult-directional Lane; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = De facto Right Turn.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

**Table 11**

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = defacto Right Turn; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = defacto Right Turn; ^ = Mult-directional Lane; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = defacto Right Turn; TS = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>5</sup> Traffic signal is projected to be warranted.

**Table 7**

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = defacto Right Turn; **TS** = Improvements.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>5</sup> 99.9 - F = Delay high, intersection unstable, Level of Service F.

**Table 9**

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

Table 10

Year 2035 Without Project Intersection Delay and Level of Service

| Intersection   | Jurisdiction | Traffic Control <sup>2</sup> | Intersection Approach Lanes <sup>1</sup> |     |     |            |     |     |           |     |     |           |     |    | Peak Hour          |                  |                  |                    |                  |                  |

| Vanderbilt Way (EW) - #9                                 | City of SB   | TS                           | 1  | 2   | 1   | 1          | 2.5 | 0.5 | 0         | 1   | 0   | 1.5       | 0.5 | 1  | 23.4               | C                | 0.624            | 19.8               | B                | 0.539            |

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = De facto Right Turn.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

Table 11

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

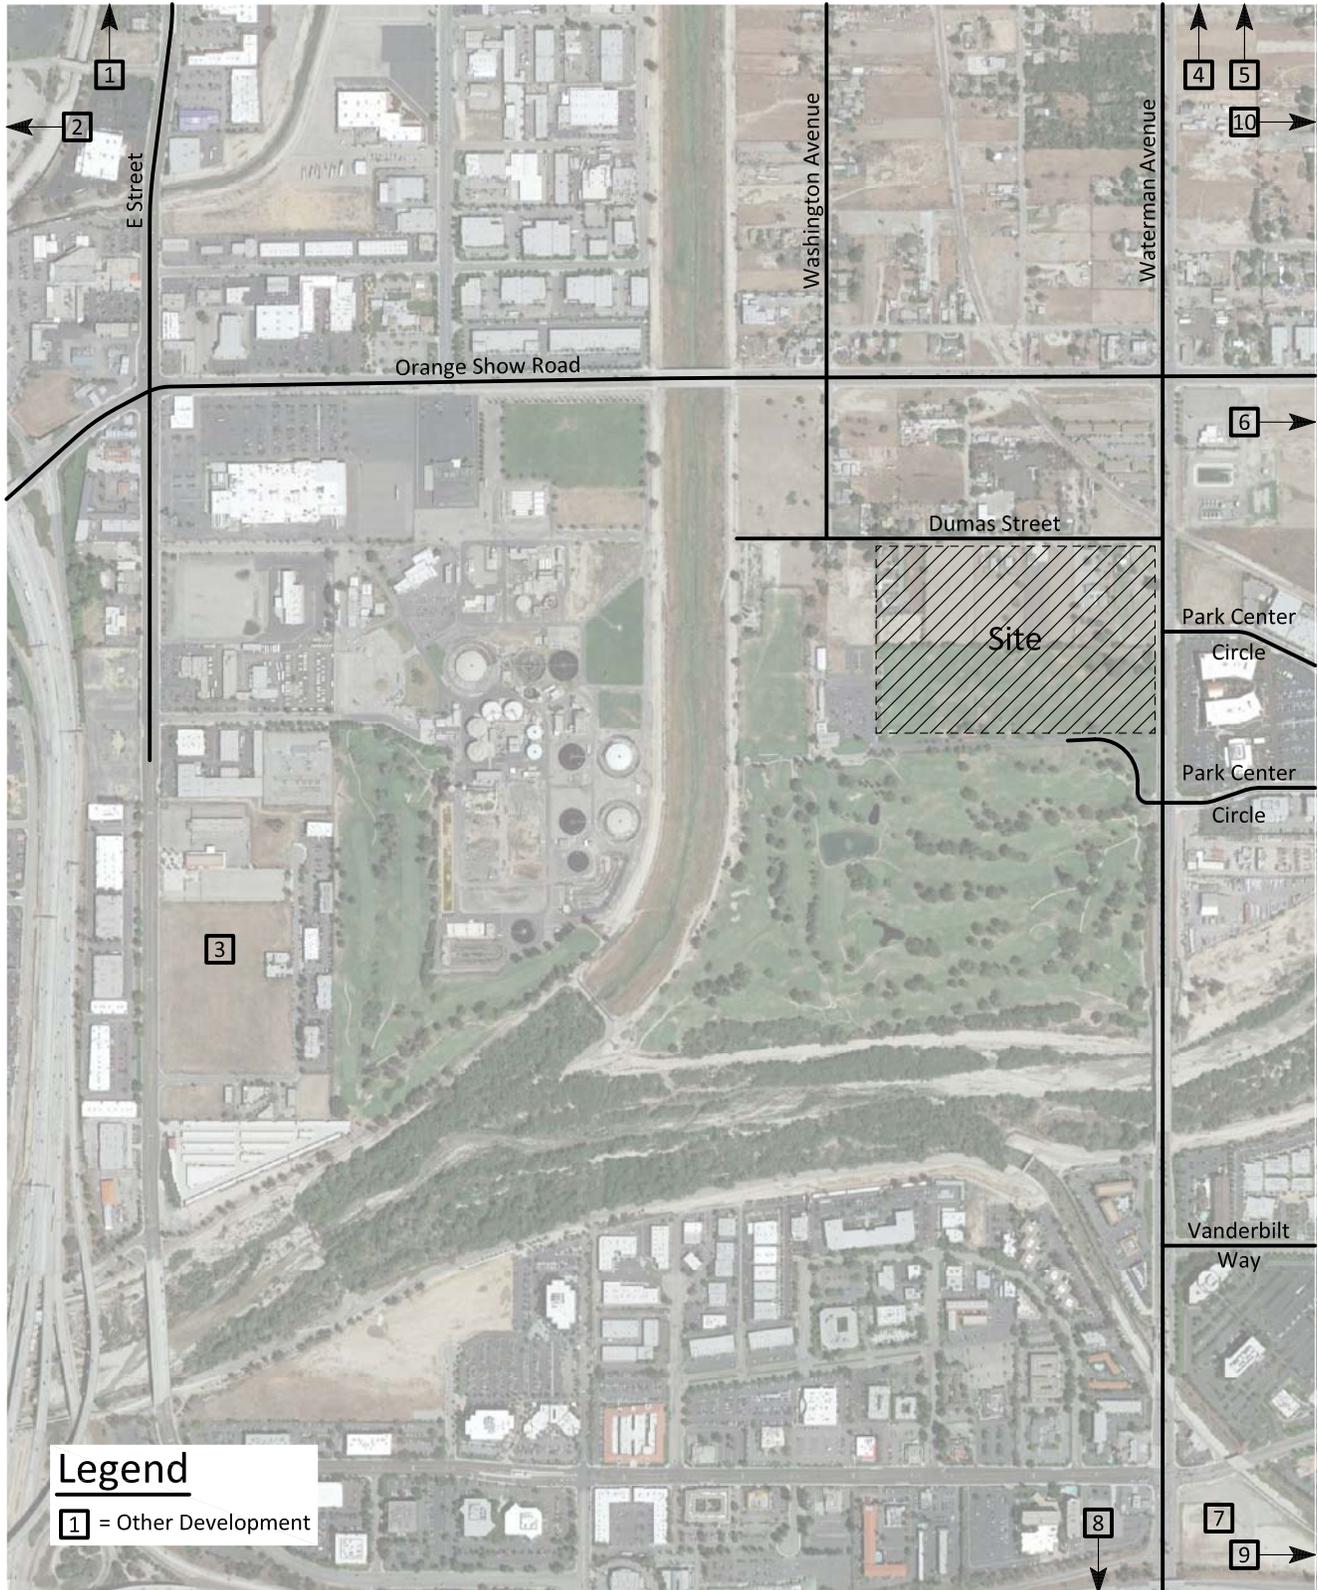

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

## V. Conclusions and Recommendations

---

---

The recommendations in this section address on-site improvements, off-site improvements and the phasing (as needed) of all necessary study area transportation improvements.

### A. On-Site Improvements

On-site improvements and improvements adjacent to the site will be required in conjunction with the proposed development to ensure adequate circulation within the project itself (see Figure 40).

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including northbound left turn lane and southbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including eastbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

Install traffic signal at Waterman Avenue and Park Center Circle North. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

### B. Off-Site Improvements

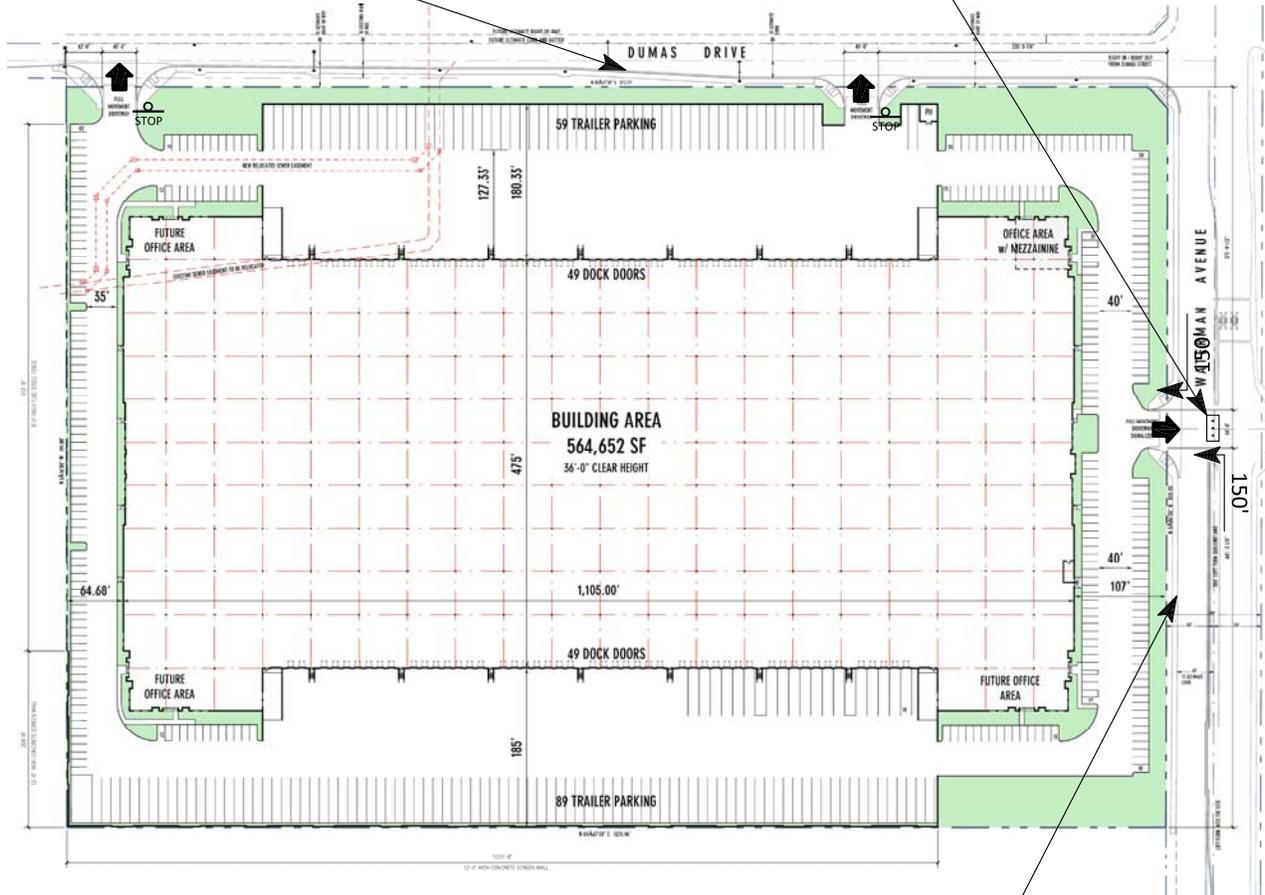

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

**Figure 40**  
**Circulation Recommendations**

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including eastbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

Install traffic signal at Waterman Avenue and Park Center Circle North. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including northbound left turn lane and southbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

### TERMS

**AVERAGE DAILY TRAFFIC:** The total volume during a year divided by the number of days in a year. Usually only weekdays are included.

**BANDWIDTH:** The number of seconds of green time available for through traffic in a signal progression.

**BOTTLENECK:** A constriction along a travelway that limits the amount of traffic that can proceed downstream from its location.

**CAPACITY:** The maximum number of vehicles that can be reasonably expected to pass over a given section of a lane or a roadway in a given time period.

**CHANNELIZATION:** The separation or regulation of conflicting traffic movements into definite paths of travel by the use of pavement markings, raised islands, or other suitable means to facilitate the safe and orderly movements of both vehicles and pedestrians.

**CLEARANCE INTERVAL:** Nearly same as yellow time. If there is an all red interval after the end of a yellow, then that is also added into the clearance interval.

**CORDON:** An imaginary line around an area across which vehicles, persons, or other items are counted (in and out).

**CYCLE LENGTH:** The time period in seconds required for one complete signal cycle.

**CUL-DE-SAC STREET:** A local street open at one end only, and with special provisions for turning around.

**DAILY CAPACITY:** The daily volume of traffic that will result in a volume during the peak hour equal to the capacity of the roadway.

**DELAY:** The time consumed while traffic is impeded in its movement by some element over which it has no control, usually expressed in seconds per vehicle.

**DEMAND RESPONSIVE SIGNAL:** Same as traffic-actuated signal.

**DENSITY:** The number of vehicles occupying in a unit length of the through traffic lanes of a roadway at any given instant. Usually expressed in vehicles per mile.

**DETECTOR:** A device that responds to a physical stimulus and transmits a resulting impulse to the signal controller.

**DESIGN SPEED:** A speed selected for purposes of design. Features of a highway, such as curvature, superelevation, and sight distance (upon which the safe operation of vehicles is dependent) are correlated to design speed.

**DIRECTIONAL SPLIT:** The percent of traffic in the peak direction at any point in time.

**DIVERSION:** The rerouting of peak hour traffic to avoid congestion.

**FORCED FLOW:** Opposite of free flow.

**FREE FLOW:** Volumes are well below capacity. Vehicles can maneuver freely and travel is unimpeded by other traffic.

**GAP:** Time or distance between successive vehicles in a traffic stream, rear bumper to front bumper.

**HEADWAY:** Time or distance spacing between successive vehicles in a traffic stream, front bumper to front bumper.

**INTERCONNECTED SIGNAL SYSTEM:** A number of intersections that are connected to achieve signal progression.

**LEVEL OF SERVICE:** A qualitative measure of a number of factors, which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operating costs.

**LOOP DETECTOR:** A vehicle detector consisting of a loop of wire embedded in the roadway, energized by alternating current and producing an output circuit closure when passed over by a vehicle.

**MINIMUM ACCEPTABLE GAP:** Smallest time headway between successive vehicles in a traffic stream into which another vehicle is willing and able to cross or merge.

**MULTI-MODAL:** More than one mode; such as automobile, bus transit, rail rapid transit, and bicycle transportation modes.

**OFFSET:** The time interval in seconds between the beginning of green at one intersection and the beginning of green at an adjacent intersection.

**PLATOON:** A closely grouped component of traffic that is composed of several vehicles moving, or standing ready to move, with clear spaces ahead and behind.

**ORIGIN-DESTINATION SURVEY:** A survey to determine the point of origin and the point of destination for a given vehicle trip.

**PASSENGER CAR EQUIVALENTS (PCE):** One car is one Passenger Car Equivalent. A truck is equal to 2 or 3 Passenger Car Equivalents in that a truck requires longer to start, goes slower, and accelerates slower. Loaded trucks have a higher Passenger Car Equivalent than empty trucks.

**PEAK HOUR:** The 60 consecutive minutes with the highest number of vehicles.

**PRETIMED SIGNAL:** A type of traffic signal that directs traffic to stop and go on a predetermined time schedule without regard to traffic conditions. Also, fixed time signal.

**PROGRESSION:** A term used to describe the progressive movement of traffic through several signalized intersections.

**SCREEN-LINE:** An imaginary line or physical feature across which all trips are counted, normally to verify the validity of mathematical traffic models.

**SIGNAL CYCLE:** The time period in seconds required for one complete sequence of signal indications.

**SIGNAL PHASE:** The part of the signal cycle allocated to one or more traffic movements.

**STARTING DELAY:** The delay experienced in initiating the movement of queued traffic from a stop to an average running speed through a signalized intersection.

**TRAFFIC-ACTUATED SIGNAL:** A type of traffic signal that directs traffic to stop and go in accordance with the demands of traffic, as registered by the actuation of detectors.

**TRIP:** The movement of a person or vehicle from one location (origin) to another (destination). For example, from home to store to home is two trips, not one.

**TRIP-END:** One end of a trip at either the origin or destination; i.e. each trip has two trip-ends. A trip-end occurs when a person, object, or message is transferred to or from a vehicle.

**TRIP GENERATION RATE:** The quantity of trips produced and/or attracted by a specific land use stated in terms of units such as per dwelling, per acre, and per 1,000 square feet of floor space.

**TRUCK:** A vehicle having dual tires on one or more axles, or having more than two axles.

**UNBALANCED FLOW:** Heavier traffic flow in one direction than the other. On a daily basis, most facilities have balanced flow. During the peak hours, flow is seldom balanced in an urban area.

**VEHICLE MILES OF TRAVEL:** A measure of the amount of usage of a section of highway, obtained by multiplying the average daily traffic by length of facility in miles.

**APPENDIX B**

**Scoping Agreement**

# Scope of Study Form

**To be completed by applicant and approved by Development Services prior to start of study**

Project Name: Waterman Industrial Center  
 Project Address: Southwest corner of Waterman Avenue and Dumas Drive  
 Project Description: 564,652 square feet of high-cube warehouse distribution center land use  
 Developer's Name: NEWCASTLE PARTNERS, INC.  
 Address: 4740 Green River Road, Suite 118 Corona, CA 92880  
 Telephone No. 951-582-9800 x23 Fax Number: 951-278-4740  
 Email Address: jackson@newcastlepartners.com

Trip Generation Rates From: ITE 9th Ed. Other: City of Fontana, Truck Trip Generation Study, August 2003

**APPENDIX F**

**Explanation and Calculation of Intersection Delay**

## **EXPLANATION AND CALCULATION OF INTERSECTION LEVEL OF SERVICE USING DELAY METHODOLOGY**

The levels of service at the unsignalized and signalized intersections are calculated using the delay methodology in the Highway Capacity Manual. This methodology views an intersection as consisting of several lane groups. A lane group is a set of lanes serving a movement. If there are two northbound left turn lanes, then the lane group serving the northbound left turn movement has two lanes. Similarly, there may be three lanes in the lane group serving the northbound through movement, one lane in the lane group serving the northbound right turn movement, and so forth. It is also possible for one lane to serve two lane groups. A shared lane might result in there being 1.5 lanes in the northbound left turn lane group and 2.5 lanes in the northbound through lane group.

For each lane group, there is a capacity. That capacity is calculated by multiplying the number of lanes in the lane group times a theoretical maximum lane capacity per lane time's 12 adjustment factors.

Each of the 12 adjustment factors has a value of approximately 1.00. A value less than 1.00 is generally assigned when a less than desirable condition occurs.

The 12 adjustment factors are as follows:

1. Peak hour factor (to account for peaking within the peak hour)
2. Lane utilization factor (to account for not all lanes loading equally)
3. Lane width
4. Percent of heavy trucks
5. Approach grade
6. Parking
7. Bus stops at intersections
8. Area type (CBD or other)
9. Right turns
10. Left turns

11. Pedestrian activity
12. Signal progression

The maximum theoretical lane capacity and the 12 adjustment factors for it are all unknowns for which approximate estimates have been recommended in the Highway Capacity Manual. For the most part, the recommended values are not based on statistical analysis but rather on educated estimates. However, it is possible to use the delay method and get reasonable results as will be discussed below.

Once the lane group volume is known and the lane group capacity is known, a volume to capacity ratio can be calculated for the lane group.

With a volume to capacity ratio calculated, average delay per vehicle in a lane group can be estimated. The average delay per vehicle in a lane group is calculated using a complex formula provided by the Highway Capacity Manual, which can be simplified and described as follows:

Delay per vehicle in a lane group is a function of the following:

1. Cycle length
2. Amount of red time faced by a lane group
3. Amount of yellow time for that lane group
4. The volume to capacity ratio of the lane group

The average delay per vehicle for each lane group is calculated, and eventually an overall average delay for all vehicles entering the intersection is calculated. This average delay per vehicle is then used to judge Level of Service. The Level of Services are defined in the table that follows this discussion.

Experience has shown that when a maximum lane capacity of 1,900 vehicles per hour is used (as recommended in the Highway Capacity Manual), little or no yellow time penalty is used, and none of the 12 penalty factors are applied, calculated delay is realistic. The delay calculation for instance assumes that yellow time is totally unused. Yet experience shows that most of the yellow time is used.

An idiosyncrasy of the delay methodology is that it is possible to add traffic to an intersection and reduce the average total delay per vehicle. If the average total delay is 30 seconds per vehicle for all vehicles traveling through an intersection, and traffic is added to a movement that has an average total delay of 15 seconds per vehicle, then the overall average total delay is reduced.

The delay calculation for a lane group is based on a concept that the delay is a function of the amount of unused capacity available. As the volume approaches capacity and there is no more unused capacity available, then the delay rapidly increases. Delay is not proportional to volume, but rather increases rapidly as the unused capacity approaches zero.

Because delay is not linearly related to volumes, the delay does not reflect how close an intersection is to overloading. If an intersection is operating at Level of Service C and has an average total delay of 18 seconds per vehicle, you know very little as to what percent the traffic can increase before Level of Service E is reached.

## LEVEL OF SERVICE DESCRIPTION<sup>1</sup>

| Level Of Service | Description  | Average Total Delay Per Vehicle (Seconds) |                |
|------------------|--|---|----------------|
|                  |  | Signalized                                | Unsignalized   |
| A                | Level of Service A occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.   | 0 to 10.00                                | 0 to 10.00     |
| B                | Level of Service B generally occurs with good progression and/or short cycle lengths. More vehicles stop than for Level of Service A, causing higher levels of average total delay.  | 10.01 to 20.00                            | 10.01 to 15.00 |
| C                | Level of Service C generally results when there is fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.  | 20.01 to 35.00                            | 15.01 to 25.00 |
| D                | Level of Service D generally results in noticeable congestion. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume to capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.   | 35.01 to 55.00                            | 25.01 to 35.00 |
| E                | Level of Service E is considered to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high volume to capacity ratios. Individual cycle failures are frequent occurrences.   | 55.01 to 80.00                            | 35.01 to 50.00 |
| F                | Level of Service F is considered to be unacceptable to most drivers. This condition often occurs with oversaturation, i.e., when arrival flow rates exceed the capacity of the intersection. It may also occur at high volume to capacity ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels. | 80.01 and up                              | 50.01 and up   |

Intersection #1 E Street (NS) at Orange Show Road (EW)

\*\*\*\*\*

Cycle (sec): 120 Critical Vol./Cap.(X): 0.388
Loss Time (sec): 8 (Y+R=3.0 sec) Average Delay (sec/veh): 29.6
Optimal Cycle: OPTIMIZED Level Of Service: C

\*\*\*\*\*

Table with 4 columns: Approach (North Bound, South Bound, East Bound, West Bound) and Movement (L, T, R). Rows include Control, Rights, Min. Green, and Lanes.

Volume Module:

Table with 13 columns representing different traffic metrics and 13 rows for various volume and adjustment factors like Base Vol, Growth Adj, Initial Bse, etc.

Saturation Flow Module:

Table with 13 columns for saturation flow metrics and 4 rows for Sat/Lane, Adjustment, Lanes, and Final Sat.

Capacity Analysis Module:

Table with 13 columns for capacity analysis metrics and 10 rows for Vol/Sat, Crit Moves, Green/Cycle, Volume/Cap, Delay/Veh, User DelAdj, AdjDel/Veh, LOS by Move, and HCM2kAvgQ.

\*\*\*\*\*

Note: Queue reported is the number of cars per lane.

**APPENDIX G**

**Traffic Signal Warrant Worksheets**

# PEAK HOUR VOLUME WARRANT (Rural Areas)

## Existing + Ambient Growth

Major Street Name = **Waterman Avenue**

Total of Both Approaches (VPH) = **1941**

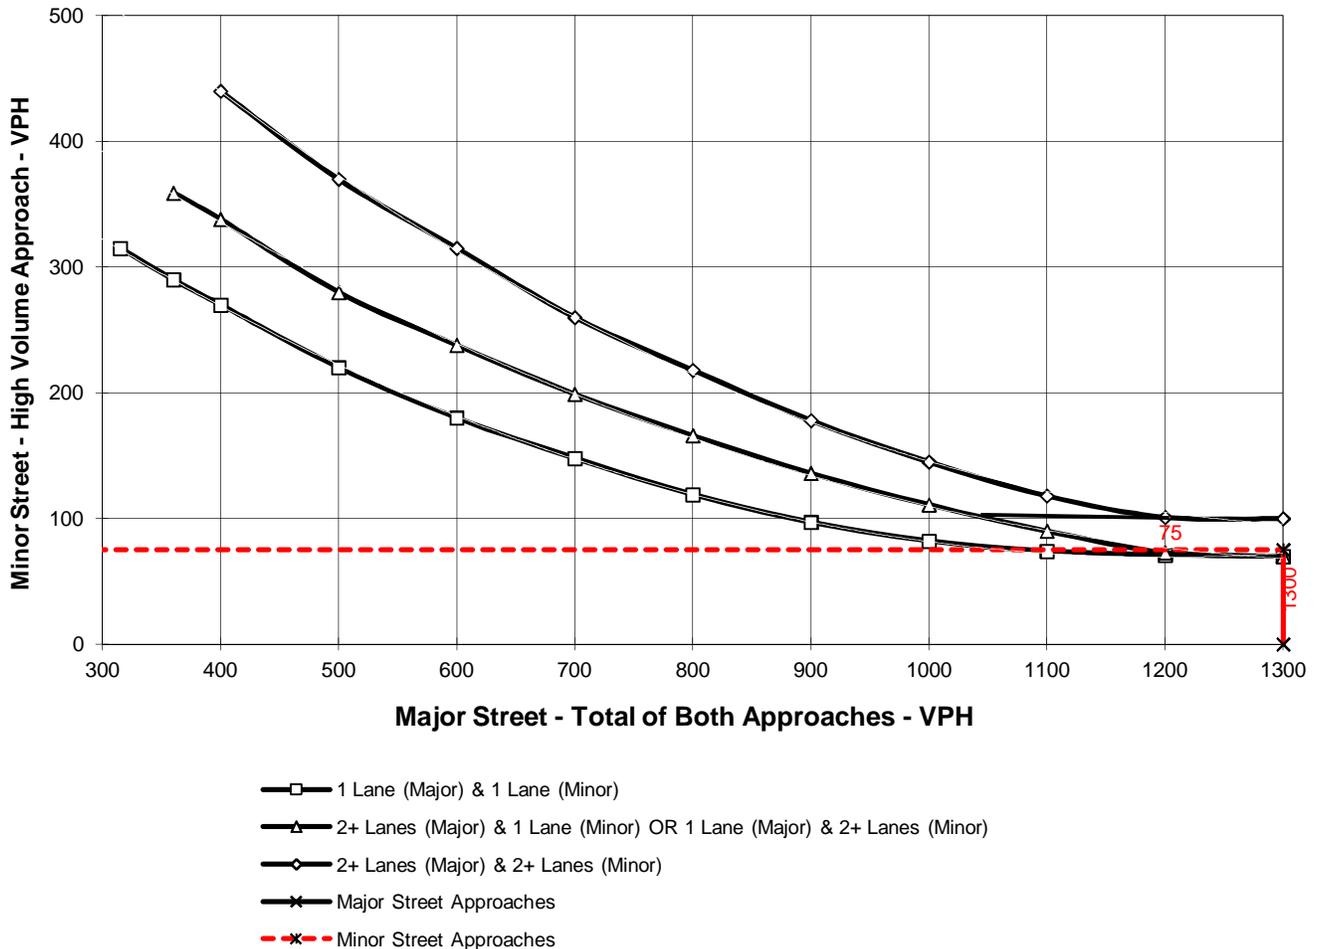

Number of Approach Lanes Major Street = **2**

Minor Street Name = **Park Center North**

High Volume Approach (VPH) = **75**

Number of Approach Lanes Minor Street = **1**

### WARRANTED FOR A SIGNAL

**\*\* NOTE:**

100 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACH WITH TWO OR MORE LANES AND 75 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACHING WITH ONE LANE.

**APPENDIX H**

**Preliminary Construction Cost Estimates for  
Congestion Management Program**

**PRELIMINARY CONSTRUCTION COST ESTIMATES  
FOR  
CONGESTION MANAGEMENT PLAN**

| <b>Add One Lane Each Direction on Freeway</b>  |   |          |                             |
|--|---|----------|-----------------------------|

**12' High Sound Walls (Masonry Block on Footing)**

| Structure Cost \$/Mile | Mobilization Design Constr. Mgt. \$/Mile | Total \$/Mile |
|------------------------|--|---------------|
| \$800,000              | \$300,000                                | \$1,100,000   |

**Widen Conventional Highway**

|  |  |
|--|--|
| 1. Add one outside lane<br>(Work includes earthwork, modify existing drainage system and construct AC shoulder section.)<br><br>Asphalt Concrete Pavement  | \$1,000,000/Mile   |
| 2. Add one outside lane each direction<br>(Work includes earthwork, modify existing drainage system and construct AC shoulder section)<br><br>Asphalt Concrete Pavement<br>With Median Concrete Barrier<br>With Median Double Thrie Beam Barrier | \$2,000,000/Mile<br>\$2,200,000/Mile<br>\$2,300,000/Mile |

**Local Interchange Improvements**

|   |                              |
|---|------------------------------|
| 1. New Interchange<br><br>Urban Interchange   | \$10,000,000 to \$17,000,000 |
| Partial – Cloverleaf Interchange<br>(Work includes new OC structure, earthwork, signal) | \$6,000,000                  |
| Diamond Interchange<br>(Work includes new OC structure, earthwork, signal)              | \$5,000,000                  |

**Local Interchange Improvements CONT...**

|    |  |                        |
|----|--|------------------------|
| 2. | Reconstruct Existing Interchange   |                        |
|    | Realign and widen existing ramps (to 2 lanes)                            | \$750,000/Each Ramp    |
|    | Construct Loop on – ramps<br>(Does not include realigning existing ramp) | \$700,000/Each Ramp    |
|    | Upgrade existing Diamond IC to Partial – Cloverleaf                      | \$6,000,000            |
| 3. | Improve Existing Interchange   |                        |
|    | Widen ramps (From one to two lanes)                                      | \$350,000/Each Ramp    |
|    | Widen existing OC structure  | \$110/Sq. Ft.          |
|    | Signalize ramp intersection  | \$90,000/Location      |
|    | Upgrade existing signal at ramp terminal                                 | \$75,000/Intersection  |
|    | Upgrade existing signal at ramp terminal<br>(Add lights only)            | \$25,000/Each          |
| 4. | Ramp Metering System   | \$60,000/Each location |

**Intersection Improvements**

|    |   |                        |
|----|---|------------------------|
| 1. | Signalization of local intersection<br>(with some roadwork) | \$250,000              |
| 2. | Upgrade existing intersection signalization                 | \$75,000               |
| 3. | Upgrade existing Traffic Controller/Assembles               | \$40,000/Each          |
| 4. | Install new signal  | \$90,000/location      |
| 5. | Add signal heads  | \$25,000/Intersection  |
| 6. | Construct left – turn lane (240' long)                      | \$50,000/Each Location |
| 7. | Street widening (12' wide) (Pavement only)                  | \$180,000/Mile         |
| 8. | Curb and gutter (Type A2-8)                                 | \$15/LF                |

| <b>Other Improvements</b>  |   |
|--|---|
| 1. Construct new OC structure<br>(Does not include roadway work) | \$100/Sq. Ft.   |
| 2. Construct Retaining Walls (Type 1)                            | \$285/LF (H=8')<br>\$360/LF (H=10')<br>\$460/LF (H=12')<br>\$560/LF (H=14')   |
| 3. Construct Soundwall   | \$1,000,000/Mile (H=12')  |
| 4. Traffic Management Plan                                       | 10% of total construction costs   |
| <b>NOTE:</b>   | This cost estimate does not include the following items:  |
|  | <ol style="list-style-type: none"> <li>1. R/W engineering, appraisal, acquisition and utilities relocation costs.</li> <li>2. Minor items and supplemental work (10%).</li> <li>3. Mobilization (10%).</li> <li>4. Contingencies (25%).</li> <li>5. Landscaping costs.</li> </ol> |
| <b>General Note:</b>   | <b>When adding a through lane, the minimum distance is 600' approach and 600' departure to the next intersection.</b>   |
