# USGS Design Maps Summary Report

## User-Specified Input

**Building Code Reference Document** ASCE 7-10 Standard  
(which utilizes USGS hazard data available in 2008)

**Site Coordinates** 34.077°N, 117.281°W

**Site Soil Classification** Site Class D - "Stiff Soil"

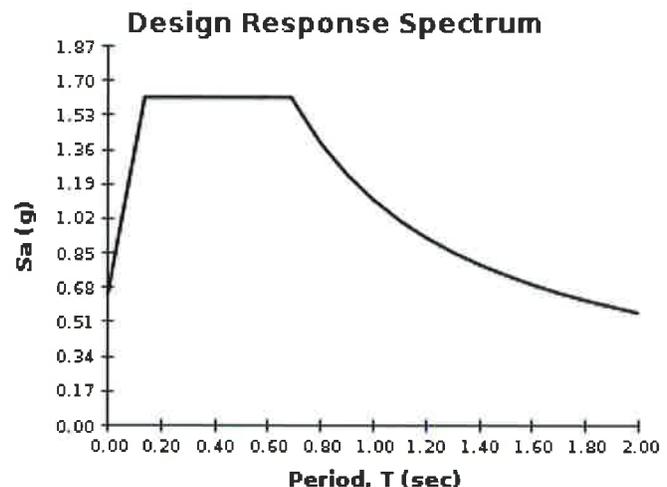

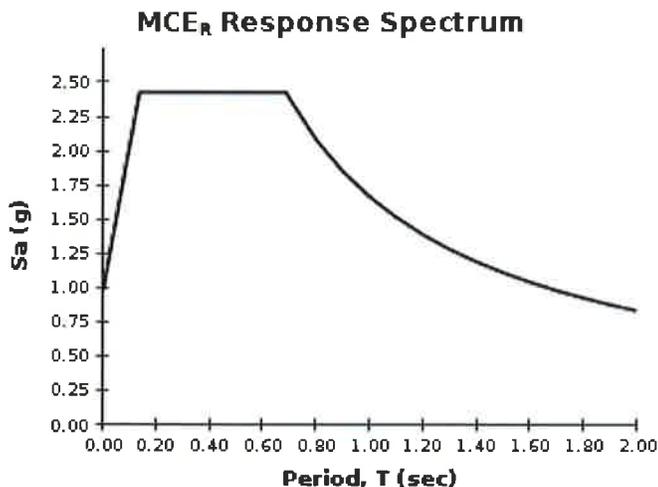

**Risk Category** I/II/III

## USGS-Provided Output

$$\begin{array}{lll}
 S_s = 2.426 \text{ g} & S_{MS} = 2.426 \text{ g} & S_{DS} = 1.617 \text{ g} \\
 S_1 = 1.111 \text{ g} & S_{M1} = 1.666 \text{ g} & S_{D1} = 1.111 \text{ g}
 \end{array}$$

For information on how the  $S_s$  and  $S_1$  values above have been calculated from probabilistic (risk-targeted) and deterministic ground motions in the direction of maximum horizontal response, please return to the application and select the "2009 NEHRP" building code reference document.

For  $PGA_M$ ,  $T_L$ ,  $C_{RS}$ , and  $C_{R1}$  values, please [view the detailed report](#).

Although this information is a product of the U.S. Geological Survey, we provide no warranty, expressed or implied, as to the accuracy of the data contained therein. This tool is not a substitute for technical subject-matter

**Design Maps Detailed Report**

ASCE 7-10 Standard (34.077°N, 117.281°W)

Site Class D – “Stiff Soil”, Risk Category I/II/III

**Section 11.4.1 — Mapped Acceleration Parameters**

Note: Ground motion values provided below are for the direction of maximum horizontal spectral response acceleration. They have been converted from corresponding geometric mean ground motions computed by the USGS by applying factors of 1.1 (to obtain  $S_s$ ) and 1.3 (to obtain  $S_1$ ). Maps in the 2010 ASCE-7 Standard are provided for Site Class B. Adjustments for other Site Classes are made, as needed, in Section 11.4.3.

**From Figure 22-1 <sup>[1]</sup>** $S_s = 2.426 \text{ g}$ **From Figure 22-2 <sup>[2]</sup>** $S_1 = 1.111 \text{ g}$ **Section 11.4.2 — Site Class**

The authority having jurisdiction (not the USGS), site-specific geotechnical data, and/or the default has classified the site as Site Class D, based on the site soil properties in accordance with Chapter 20.

Table 20.3–1 Site Classification

| <b>Site Class</b>   | $\bar{v}_s$         | $\bar{N}$ or $\bar{N}_{ch}$ | $\bar{s}_u$        |
|---|---------------------|-----------------------------|--------------------|
| A. Hard Rock  | >5,000 ft/s         | N/A                         | N/A                |
| B. Rock   | 2,500 to 5,000 ft/s | N/A                         | N/A                |
| C. Very dense soil and soft rock  | 1,200 to 2,500 ft/s | >50                         | >2,000 psf         |
| D. Stiff Soil   | 600 to 1,200 ft/s   | 15 to 50                    | 1,000 to 2,000 psf |
| E. Soft clay soil   | <600 ft/s           | <15                         | <1,000 psf         |
| Any profile with more than 10 ft of soil having the characteristics:  |                     |                             |                    |
| <ul style="list-style-type: none"> <li>• Plasticity index <math>PI &gt; 20</math>,</li> <li>• Moisture content <math>w \geq 40\%</math>, and</li> <li>• Undrained shear strength <math>\bar{s}_u &lt; 500 \text{ psf}</math></li> </ul> |                     |                             |                    |
| F. Soils requiring site response analysis in accordance with Section 21.1   | See Section 20.3.1  |                             |                    |

For SI: 1ft/s = 0.3048 m/s 1lb/ft<sup>2</sup> = 0.0479 kN/m<sup>2</sup>

### Section 11.4.3 — Site Coefficients and Risk-Targeted Maximum Considered Earthquake ( $MCE_R$ ) Spectral Response Acceleration Parameters

Table 11.4-1: Site Coefficient  $F_a$ 

| Site Class | Mapped $MCE_R$ Spectral Response Acceleration Parameter at Short Period |              |              |              |                 |
|------------|---|--------------|--------------|--------------|-----------------|
|            | $S_s \leq 0.25$   | $S_s = 0.50$ | $S_s = 0.75$ | $S_s = 1.00$ | $S_s \geq 1.25$ |
| A          | 0.8   | 0.8          | 0.8          | 0.8          | 0.8             |
| B          | 1.0   | 1.0          | 1.0          | 1.0          | 1.0             |
| C          | 1.2   | 1.2          | 1.1          | 1.0          | 1.0             |
| D          | 1.6   | 1.4          | 1.2          | 1.1          | 1.0             |
| E          | 2.5   | 1.7          | 1.2          | 0.9          | 0.9             |
| F          | See Section 11.4.7 of ASCE 7  |              |              |              |                 |

Note: Use straight-line interpolation for intermediate values of  $S_s$

**For Site Class = D and  $S_s = 2.426$  g,  $F_a = 1.000$**

Table 11.4-2: Site Coefficient  $F_v$ 

| Site Class | Mapped $MCE_R$ Spectral Response Acceleration Parameter at 1-s Period |              |              |              |                 |
|------------|---|--------------|--------------|--------------|-----------------|
|            | $S_1 \leq 0.10$   | $S_1 = 0.20$ | $S_1 = 0.30$ | $S_1 = 0.40$ | $S_1 \geq 0.50$ |
| A          | 0.8   | 0.8          | 0.8          | 0.8          | 0.8             |
| B          | 1.0   | 1.0          | 1.0          | 1.0          | 1.0             |
| C          | 1.7   | 1.6          | 1.5          | 1.4          | 1.3             |
| D          | 2.4   | 2.0          | 1.8          | 1.6          | 1.5             |
| E          | 3.5   | 3.2          | 2.8          | 2.4          | 2.4             |
| F          | See Section 11.4.7 of ASCE 7  |              |              |              |                 |

Note: Use straight-line interpolation for intermediate values of  $S_1$

**For Site Class = D and  $S_1 = 1.111$  g,  $F_v = 1.500$**

**Equation (11.4-1):**  $S_{MS} = F_a S_S = 1.000 \times 2.426 = 2.426 \text{ g}$

**Equation (11.4-2):**  $S_{M1} = F_v S_1 = 1.500 \times 1.111 = 1.666 \text{ g}$

#### Section 11.4.4 — Design Spectral Acceleration Parameters

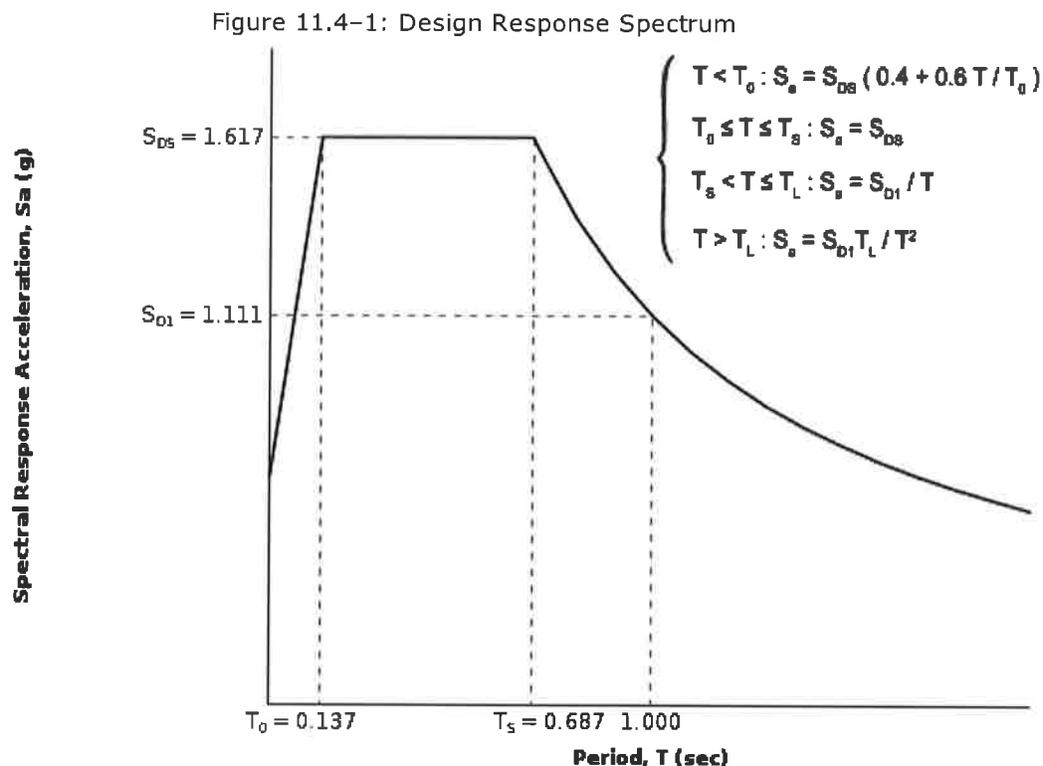

**Equation (11.4-3):**  $S_{DS} = \frac{2}{3} S_{MS} = \frac{2}{3} \times 2.426 = 1.617 \text{ g}$

**Equation (11.4-4):**  $S_{D1} = \frac{2}{3} S_{M1} = \frac{2}{3} \times 1.666 = 1.111 \text{ g}$

#### Section 11.4.5 — Design Response Spectrum

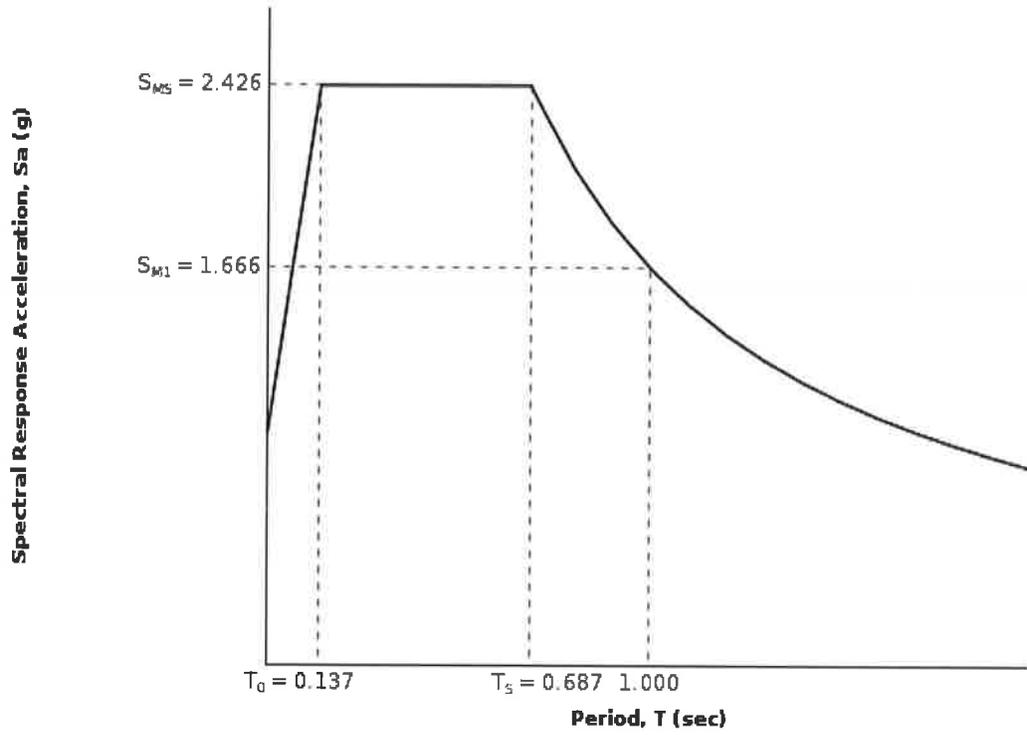

From **Figure 22-12** <sup>[3]</sup>

$T_L = 8 \text{ seconds}$

### Section 11.4.6 — Risk-Targeted Maximum Considered Earthquake (MCE<sub>R</sub>) Response Spectrum

The MCE<sub>R</sub> Response Spectrum is determined by multiplying the design response spectrum above by 1.5.

### Section 11.8.3 — Additional Geotechnical Investigation Report Requirements for Seismic Design Categories D through F

From **Figure 22-7** <sup>[4]</sup>

$$PGA = 0.932$$

**Equation (11.8-1):**

$$PGA_M = F_{PGA} PGA = 1.000 \times 0.932 = 0.932 \text{ g}$$

Table 11.8-1: Site Coefficient  $F_{PGA}$

| Site Class | Mapped MCE Geometric Mean Peak Ground Acceleration, PGA |            |            |            |            |
|------------|---|------------|------------|------------|------------|
|            | PGA ≤ 0.10  | PGA = 0.20 | PGA = 0.30 | PGA = 0.40 | PGA ≥ 0.50 |
| A          | 0.8   | 0.8        | 0.8        | 0.8        | 0.8        |
| B          | 1.0   | 1.0        | 1.0        | 1.0        | 1.0        |
| C          | 1.2   | 1.2        | 1.1        | 1.0        | 1.0        |
| D          | 1.6   | 1.4        | 1.2        | 1.1        | 1.0        |
| E          | 2.5   | 1.7        | 1.2        | 0.9        | 0.9        |
| F          | See Section 11.4.7 of ASCE 7                            |            |            |            |            |

Note: Use straight-line interpolation for intermediate values of PGA

**For Site Class = D and PGA = 0.932 g,  $F_{PGA} = 1.000$**

### Section 21.2.1.1 — Method 1 (from Chapter 21 – Site-Specific Ground Motion Procedures for Seismic Design)

From **Figure 22-17** <sup>[5]</sup>

$$C_{RS} = 1.011$$

From **Figure 22-18** <sup>[6]</sup>

$$C_{R1} = 0.964$$

## Section 11.6 — Seismic Design Category

Table 11.6-1 Seismic Design Category Based on Short Period Response Acceleration Parameter

| VALUE OF $S_{DS}$            | RISK CATEGORY |     |    |
|------------------------------|---------------|-----|----|
|                              | I or II       | III | IV |
| $S_{DS} < 0.167g$            | A             | A   | A  |
| $0.167g \leq S_{DS} < 0.33g$ | B             | B   | C  |
| $0.33g \leq S_{DS} < 0.50g$  | C             | C   | D  |
| $0.50g \leq S_{DS}$          | D             | D   | D  |

**For Risk Category = I and  $S_{DS} = 1.617 g$ , Seismic Design Category = D**

Table 11.6-2 Seismic Design Category Based on 1-S Period Response Acceleration Parameter

| VALUE OF $S_{D1}$             | RISK CATEGORY |     |    |
|-------------------------------|---------------|-----|----|
|                               | I or II       | III | IV |
| $S_{D1} < 0.067g$             | A             | A   | A  |
| $0.067g \leq S_{D1} < 0.133g$ | B             | B   | C  |
| $0.133g \leq S_{D1} < 0.20g$  | C             | C   | D  |
| $0.20g \leq S_{D1}$           | D             | D   | D  |

**For Risk Category = I and  $S_{D1} = 1.111 g$ , Seismic Design Category = D**

Note: When  $S_1$  is greater than or equal to 0.75g, the Seismic Design Category is **E** for buildings in Risk Categories I, II, and III, and **F** for those in Risk Category IV, irrespective of the above.

Seismic Design Category  $\equiv$  "the more severe design category in accordance with Table 11.6-1 or 11.6-2" = E

Note: See Section 11.6 for alternative approaches to calculating Seismic Design Category.

## **I. Introduction and Setting**

---

### **A. Purpose and Objectives**

The purpose of this report is to provide an assessment of the noise impacts that may occur with the development of the proposed Waterman Industrial Center project and to identify mitigation measures that may be necessary to reduce those impacts.

Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with those terms unique to noise analysis, a glossary of terms is provided in Appendix A of this report.

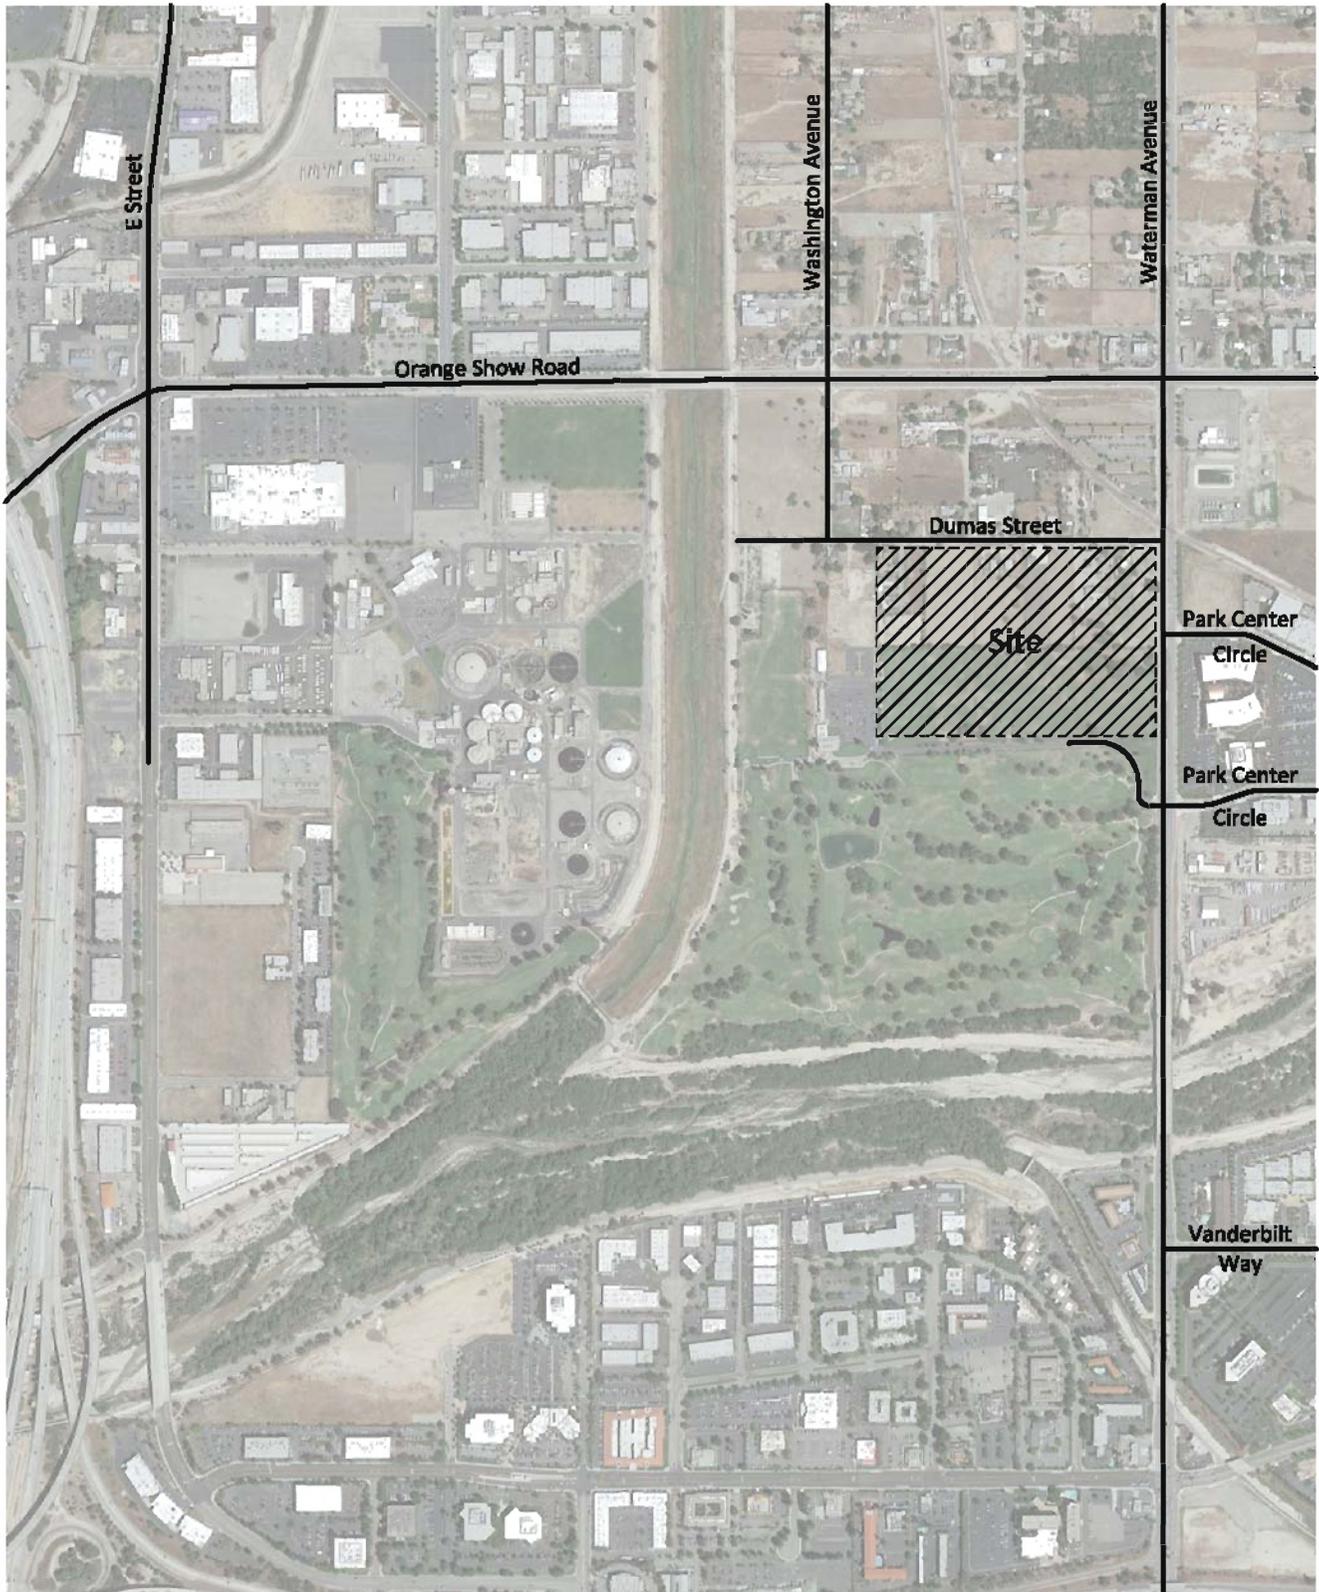

### **B. Project Location**

The project is located within the City of San Bernardino, on the southwest corner of the Waterman Avenue and Dumas Drive. A vicinity map showing the project location is provided on Figure 1.

### **C. Project Description**

The approximately 25.25 acre project site is proposed to be developed with a 564,652 square foot high-cube warehouse distribution center with 452 total parking stalls, including 281 warehouse parking spaces and 171 trailer parking spaces, and 24 bicycle stalls. The project also includes 103,585 gross square feet of landscaping. The proposed project will have access to Waterman Avenue and Dumas Drive. Figure 2 illustrates the project site plan.

**Figure 1**

## II. Noise and Vibration Fundamentals

---

### A. Noise Fundamentals

Sound is a pressure wave created by a moving or vibrating source that travels through an elastic medium such as air. Noise is defined as unwanted or objectionable sound. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and in extreme circumstances, hearing impairment.

Commonly used noise terms are presented in Appendix B. The unit of measurement used to describe a noise level is the decibel (dB). The human ear is not equally sensitive to all frequencies within the sound spectrum. Therefore, the “A-weighted” noise scale, which weights the frequencies to which humans are sensitive, is used for measurements. Noise levels using A-weighted measurements are written dB(A) or dBA.

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features. Sound from point sources, such as air conditioning condensers, radiates uniformly outward as it travels away from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD). Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

Decibels are measured on a logarithmic scale, which quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. Thus, a doubling of the energy of a noise source, such as a doubled traffic volume, would increase the noise levels by 3 dBA; halving of the energy would result in a 3 dBA decrease.

Figure 3 shows the relationship of various noise levels to commonly experienced noise events.

Average noise levels over a period of minutes or hours are usually expressed as  $\text{dBA}_{\text{Leq}}$ , or the equivalent noise level for that period of time. For example,  $\text{Leq}(3)$  would represent a 3-hour average. When no period is specified, a one-hour average is assumed.

Noise standards for land use compatibility are stated in terms of the Community Noise Equivalent Level (CNEL) and the Day-Night Average Noise Level ( $L_{\text{dn}}$ ). CNEL is a 24-hour weighted average measure of community noise. CNEL is obtained by adding five decibels to sound levels in the evening (7:00 PM to 10:00 PM), and by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human

sensitivity to noise during the evening and nighttime hours.  $L_{dn}$  is a very similar 24-hour average measure that weights only the nighttime hours.

It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA; that a change of 5 dBA is readily perceptible, and that an increase (decrease) of 10 dBA sounds twice (half) as loud. This definition is recommended by the California Department of Transportation's Traffic Noise Analysis Protocol for New Highway and Reconstruction Projects (2009).

## **B. Vibration Fundamentals**

The way in which vibration is transmitted through the earth is called propagation. Propagation of earthborn vibrations is complicated and difficult to predict because of the endless variations in the soil through which waves travel. There are three main types of vibration propagation: surface, compression and shear waves. Surface waves, or Raleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water. Compression waves, or P-waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. Shear waves, or S-waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation".

As vibration waves propagate from a source, the energy is spread over an ever-increasing area such that the energy level striking a given point is reduced with the distance from the energy source. This geometric spreading loss is inversely proportional to the square of the distance. Wave energy is also reduced with distance as a result of material damping in the form of internal friction, soil layering, and void spaces. The amount of attenuation provided by material damping varies with soil type and condition as well as the frequency of the wave.

Construction operations generally include a wide range of activities that can generate groundborne vibration. Vibratory compactors or rollers, pile drivers, and pavement breakers can generate perceptible amounts of vibration at up to 200 feet. Heavy trucks can also generate groundborne vibrations, which can vary depending on vehicle type, weight, and pavement conditions. Potholes, pavement joints, discontinuities, or the differential settlement of pavement all increase the vibration levels from vehicles passing over a road surface. Construction vibration is normally of greater concern than vibration from normal traffic flows on streets and freeways with smooth pavement conditions.

Typically, particle velocity or acceleration (measured in gravities) is used to describe vibration. Table 1 shows the peak particle velocities (PPV) of some common construction equipment and Table 2 shows typical human reactions to various levels of PPV as well as the effect of PPV on buildings.

**Table 1****Vibration Source Levels for Construction Equipment<sup>1</sup>**

| Equipment                      | Peak Particle Velocity<br>(inches/second) at 25 feet | Approximate Vibration Level<br>LV (dVB) at 25 feet |
|--------------------------------|--|--|
| Pile driver (impact)           | 1.518 (upper range)                                  | 112  |
|                                | 0.644 (typical)                                      | 104  |
| Pile driver (sonic)            | 0.734 upper range                                    | 105  |
|                                | 0.170 typical  | 93   |
| Clam shovel drop (slurry wall) | 0.202  | 94   |
| Hydromill                      | 0.008 in soil  | 66   |
| (slurry wall)                  | 0.017 in rock  | 75   |
| Vibratory Roller               | 0.21   | 94   |

### Figure 3 Common Noise Sources and Noise Levels

### III. Existing Noise Environment

---

#### A. Existing Land Uses and Sensitive Receptors

The project site is bordered on the north by Dumas Street and on the east by Waterman Avenue. Just past Dumas Street are single-family detached residential dwelling units, while vacant land and office land uses are located just past Waterman Avenue. To the south, adjacent to the project site, is the San Bernardino Public Golf Course. To the west of the project site are a single-family detached residential dwelling unit and the San Bernardino Public Golf Course's parking lot.

The State of California defines sensitive receptors as those land uses that require serenity or are otherwise adversely affected by noise events or conditions. Schools, libraries, churches, hospitals, single and multiple-family residential, including transient lodging, motels and hotel uses make up the majority of these areas. Sensitive receptors that may be affected by project generated noise include the surrounding single-family detached residential dwelling units adjacent to and in the vicinity of the project site.

#### B. Ambient Noise Measurements

An American National Standards Institute (ANSI Section S14 1979, Type 1) Larson Davis model LxT sound level meter was used to document existing ambient noise levels. In order to document existing ambient noise levels in the project area, four (4) 10-minute daytime noise measurements were taken between 11:15 AM and 12:22 PM on September 23, 2015. Field sheets and measurement output data is included in Appendix C.

As shown on Figure 4, the noise measurements were taken near existing noise sensitive areas surrounding the project site. Table 3 provides a summary of the short-term ambient noise data. Ambient noise levels ranged from 44.0 to 60.1 dBA  $L_{eq}$  during the daytime and are estimated to range from 49.0 to 65.1 dBA  $L_{eq}$  during the nighttime hours. The dominant noise source was from vehicles traveling along roadways. Conversations of nearby persons and bird chirping were also audible.

<sup>1</sup> See Figure 4 for noise measurement location. Each measurement was performed over a 10-minute duration.

<sup>2</sup> Noise measurements performed on June 24, 2015.

## IV. Regulatory Setting

---

### A. Federal Regulations

#### 1. Federal Noise Control Act of 1972

The U.S. Environmental Protection Agency (EPA) Office of Noise Abatement and Control was originally established to coordinate federal noise control activities. After its inception, EPA's Office of Noise Abatement and Control issued the Federal Noise Control Act of 1972, establishing programs and guidelines to identify and address the effects of noise on public health, welfare, and the environment. In response, the EPA published Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (Levels of Environmental Noise). The Levels of Environmental Noise recommended that the Ldn should not exceed 55 dBA outdoors or 45 dBA indoors to prevent significant activity interference and annoyance in noise-sensitive areas.

In addition, the Levels of Environmental Noise identified five (5) dBA as an "adequate margin of safety" for a noise level increase relative to a baseline noise exposure level of 55 dBA Ldn (i.e., there would not be a noticeable increase in adverse community reaction with an increase of five dBA or less from this baseline level). The EPA did not promote these findings as universal standards or regulatory goals with mandatory applicability to all communities, but rather as advisory exposure levels below which there would be no risk to a community from any health or welfare effect of noise.

In 1981, EPA administrators determined that subjective issues such as noise would be better addressed at lower levels of government. Consequently, in 1982 responsibilities for regulating noise control policies were transferred to State and local governments. However, noise control guidelines and regulations contained in EPA rulings in prior years remain in place by designated Federal agencies, allowing more individualized control for specific issues by designated Federal, State, and local government agencies.

### B. State Regulations

#### 1. State of California General Plan Guidelines 2003

Though not adopted by law, the State of California General Plan Guidelines 2003, published by the California Governor's Office of Planning and Research (OPR) (OPR Guidelines), provide guidance for the compatibility of projects within areas of specific noise exposure. The OPR Guidelines identify the suitability of various types of construction relative to a range of outdoor noise levels and provide each local community some flexibility in setting local noise standards that allow for the variability in community preferences. Findings presented in the Levels of Environmental Noise Document (EPA 1974) influenced the recommendations of the OPR Guidelines, most importantly in the choice of noise exposure metrics (i.e., Ldn or CNEL) and in the upper limits for the Normally Acceptable outdoor exposure of noise-sensitive uses. The OPR

Guidelines include a Noise and Land Use Compatibility Matrix identifies acceptable and unacceptable community noise exposure limits for various land use categories. The City of San Bernardino utilizes the compatibility matrix.

**C. Local Regulations**

The City of San Bernardino outlines their noise regulations and standards within the Noise Element from the General Plan and the Municipal Code. For purposes of this analysis, the City of San Bernardino’s Noise Element was used to evaluate both the traffic and stationary noise impacts from the proposed project.

Since there are sensitive receptors near the project site, this analysis applies to the City’s residential noise standards. The City specifies that the exterior noise levels at residential locations should not exceed 65 dBA CNEL while interior levels shall not exceed 45 dBA CNEL.

In addition, this analysis compares the proposed project to the Land Use Compatibility Matrix (see Figure 3) to gauge the compatibility of land uses relative to existing and future noise levels.

**Land Use Compatibility for Community Noise Exposure**

The City utilizes the Land Use Compatibility for Community Noise Exposure Guidelines (shown in Table 4) to gauge the compatibility of land uses relative to existing and future noise levels. Based on guidelines shown in Table 4, single-family detached residential dwelling units are considered to be normally acceptable in noise environments of up to 60 dBA CNEL and conditionally acceptable in noise environments that reach up to 70 dBA CNEL. New construction projects in areas where future noise levels are expected to range between 60-70 dBA CNEL should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features are included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

**Goals, Policies, and Implementation Measures**

The City utilizes the following General Plan Noise Element goals, policies and implementation measures to assess and evaluate the project’s suitability in light of noise impacts.

**Goal 14.1** Ensure that residents are protected from excessive noise through careful land planning.

*Policies:*

14.1.2 Require that automobile and truck access to commercial properties abutting residential parcels be located at the maximum practical distance from the residential parcel.

14.1.3 Require that all parking for commercial uses abutting residential areas be enclosed within a structure, buffered by walls, and/or limited hours of operation.

**Goal 14.2** Encourage the reduction of noise from transportation-related noise sources such as motor vehicles, aircraft operations, and railroad movements.

*Policies:*

14.2.3 Require that development that increases the ambient noise level adjacent to noise-sensitive land uses provide appropriate mitigation measures.

14.2.17 Ensure that new development is compatible with the noise compatibility criteria and noise contours as defined in the Comprehensive Land Use Plan shown in Table 4.

**Goal 14.3** Protect residents from the negative effects of “spill over” or nuisance noise.

*Policies:*

14.3.1 Require that construction activities adjacent to residential units be limited as necessary to prevent adverse noise impacts.

14.3.2 Require that construction activities employ feasible and practical techniques that minimize the noise impacts on adjacent uses.

1. City of San Bernardino Municipal Ordinance

Section 8.54 and 19.20.15 outline the City’s noise ordinance which is intended to establish city-wide standards for the regulation noise.

City of San Bernardino Ordinance 8.54.050 prohibits loading or unloading, operation of dollies, carts, forklifts, or other wheeled equipment that may cause impulsive sound, raucous, or unnecessary noise within one thousand (1,000) feet of a residence between the hours of 8:00 a.m. and 8:00 p.m. in residential zones and other than between the hours of 7:00 a.m. and 8:00 p.m. in all other zones.

Per City of San Bernardino Ordinance 8.54.070, no person shall be engaged or employed in any work of construction, erection, alteration, repair, addition, movement, demolition, or improvement to any building or structure except within the hours of 7:00 am and 8:00 pm.

Section 19.20.15 specifies residential exterior/interior noise levels shall not exceed 65 dBA and 45 dBA, respectively.

2. Vibration

Section 19.20.28 states that no vibration associated with any use shall be permitted which is discernible beyond the boundary line of the property.

Table 4

Noise and Land Use Compatibility Matrix<sup>1</sup>

| Land Use Category   | COMMUNITY NOISE EXPOSURE LEVEL Ldn or CNEL, dBA |    |    |    |    |    |
|---|---|----|----|----|----|----|
|   | 55  | 60 | 65 | 70 | 75 | 80 |
| Residential-Low Density<br>Single Family, Duplex,<br>Mobile Homes |   |    |    |    |    |    |
|   |   |    |    |    |    |    |
| Residential-Multiple Family                                       |   |    |    |    |    |    |
|   |   |    |    |    |    |    |
| Transient Lodging: Motels,<br>Hotels                              |   |    |    |    |    |    |
|   |   |    |    |    |    |    |

|   |   |    |    |    |    |    |
| Auditoriums, Concert Halls,<br>Amphitheaters                      |   |    |    |    |    |    |
|   |   |    |    |    |    |    |
| Sports Arenas, Outdoor<br>Spectator Sports                        |   |    |    |    |    |    |
|   |   |    |    |    |    |    |
| Playgrounds,<br>Neighborhood Parks                                |   |    |    |    |    |    |
|   |   |    |    |    |    |    |
| Golf Courses, Riding<br>Stables, Water Recreation,<br>Cemeteries  |   |    |    |    |    |    |
|   |   |    |    |    |    |    |
| Office Buildings,<br>Businesses, Commercial<br>and Professional   |   |    |    |    |    |    |
|   |   |    |    |    |    |    |
| Industrial, Manufacturing,<br>Utilities, Agriculture              |   |    |    |    |    |    |
|   |   |    |    |    |    |    |

|  |   |   |   |
|--|---|---|---|
|  |   |   |   |
| <p><b>Normally Acceptable:</b></p> <p>Specified land uses is satisfactory based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation or requirements.</p> | <p><b>Conditionally Acceptable:</b></p> <p>New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice. Outdoor environment will seem noisy.</p> | <p><b>Normally Unacceptable:</b></p> <p>New construction and development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made with needed noise insulation features included in the design. Outdoor areas must be shielded.</p> | <p><b>Clearly Unacceptable:</b></p> <p>New construction or development should generally not be undertaken. Construction costs to make the indoor environment acceptable would be prohibitive and the outdoor environment would not be usable.</p> |

## V. Impact Analysis

---

### A. Noise Impacts

#### 1. Construction Noise

Construction noise is considered a short-term impact and would be considered significant if construction activities are undertaken outside the allowable times as described by the City's Municipal Code (Section 8.54.070). Existing single-family detached residential dwelling units located adjacent to the project site may be affected by short-term noise impacts associated the transport of workers, the movement of construction materials to and from the project site, ground clearing, excavation, grading, and building activities.

Project generated construction noise will vary depending on the construction process, type of equipment involved, location of the construction site with respect to sensitive receptors, the schedule proposed to carry out each task (e.g., hours and days of the week) and the duration of the construction work. Site preparation is expected to produce the highest sustained construction noise levels. Typical noise sources and noise levels associated with the site grading phase of construction are shown in Table 5. Typical operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings. A likely worst-case construction noise scenario assuming the use of this equipment was calculated using the Federal Highway Administration's Roadway Construction Noise Model (RCNM) (see Appendix D) assuming the use of a grader, a dozer, excavator and a dump truck all operating between 75 and 250 feet from the nearest sensitive receptor. Assuming a use factor of 40 percent for each piece of equipment, unmitigated noise levels at would reach 78.2 dBA  $L_{eq}$  and 81.5 dBA $L_{max}$  at the nearest residential structures.

As stated earlier, the City has an exemption for construction-related noise however noise reduction measures are provided to reduce temporary noise levels in Section VI of this report. These reduction measures yield up to a 10 dBA reduction in the noise such that noise levels during construction would be reduced to 68.2 dBA  $L_{eq}$  and 71.5 dBA $L_{max}$ .

#### 2. Project Generated On-Site Operational Noise

Sensitive receptors that may be affected by project operational noise include single-family detached residential dwelling units north and west of the project site. Although not normally considered to be noise sensitive land uses, the golf course located south and southwest of the project site and the office buildings located east of the project site have been assigned normally acceptable, conditionally acceptable and normally unacceptable noise levels in the Land Use Compatibility for Noise Exposure Table (see Table 4).

On-site project operational noise was modeled utilizing the SoundPLAN model. Modeled noise sources including noise associated with parking areas, idling trucks, loading and unloading activities, trucks' diesel engines, exhaust systems, braking, and forklifts and potential rooftop HVAC. The noisiest hour for all of these activities occurring simultaneously was modeled in SoundPLAN. Worst-case CNELs (assuming continuous 24-hour operation, were also calculated.

Loading/unloading area were modeled as area sources and include activities such as trucks' diesel engines, exhaust systems, braking, and forklifts. Noise levels associated with loading/unloading can range between 65 to 80 dBA.

Parking lot noise was modeling based on the number of expected parking movements during the peak hour. Noise associated with parking lots include but are not limited to idling cars, doors closing, and starting engine noise. Noise levels associated with parking lots can reach peak levels of 80 dBA.

The rooftop HVAC equipment was modeled as a point source and was placed on-top of the structure's roof. SoundPLAN's reference level of 70.3 dBA was utilized for modeling purposes.

As shown on Figures 5 and 6, a total of sixteen (16) sensitive receptors were modeled to accurately evaluate the proposed project's operational noise impact. A receptor is denoted by a yellow dot. Figure 5 shows the unmitigated operational noise levels at the nearest sensitive receptors. Unmitigated peak hour noise levels at nearby land uses would range between 50.5 to 62.9 dBA  $L_{eq}$  (peak hr.) and 57-70 CNEL. More specifically, project operational noise levels at nearby single-family detached residential dwelling units would range between 62-70; between 57-68 at the adjacent golf course facilities; and between 58-60 at the office buildings located east of the project site. The unmitigated operational noise levels at residences directly north of the project site will exceed the City's 65 dBA CNEL limit and therefore the project requires an eight (8) foot barrier to reduce the noise level below the City's 65 dBA limit. The proposed wall location is shown on Figure 6. The City's applicable land use compatibility criteria for the adjacent golf course (75 dBA CNEL) and the nearby office buildings (70 dBA CNEL) will not be exceeded.

Figure 6 shows that with construction of the proposed barrier operational noise levels are expected to range from 50.5 to 58.2 dBA  $L_{eq}$  (peak hr.) and 57-65 dBA CNEL and will not exceed the City's 65 dBA CNEL noise level criteria and is therefore consistent with the City's Noise Element.

## 2. Noise Impacts to Off-Site Receptors Due to Project Generated Traffic

A worst-case project generated traffic noise level was modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Traffic noise levels were calculated 50 feet from the centerline of the analyzed roadway. The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference in with and without project

conditions. In addition, the noise contours for 55, 60, 65 and 70 dBA CNEL were calculated. Roadway input parameters including average daily traffic volumes (ADTs), speeds, and vehicle distribution data is shown in Table 6. The potential off-site noise impacts caused by an increase of traffic from operation of the proposed project on the nearby roadways were calculated for the following scenarios:

*Existing Year (without Project):* This scenario refers to existing year traffic noise conditions and is demonstrated in Table 7.

*Existing Year (Plus Project):* This scenario refers to existing year traffic noise conditions and is demonstrated in Table 8.

Table 9 compares the without and with project scenario and shows the change in traffic noise levels as a result of the proposed project. It takes a change of 3 dB or more to hear an audible difference. As demonstrated in Table 9, the project is anticipated to change the noise nominal amount (approximately 0 to 0.3 dBA CNEL). The change in noise level would not be audible and would be considered less than significant. Traffic noise calculation outputs are included as Appendix E.

## **B. Vibration Impacts**

This impact discussion analyzes the potential for the proposed project to cause an exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels. Vibration levels in the project area may be influenced by construction. A vibration impact would generally be considered significant if it involves any construction-related or operations-related impacts in excess of 0.2 +inches per second (in/sec) PPV.

### **1. Construction Vibration**

Construction activity can result in varying degrees of ground vibration, depending on the equipment used on the site. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings respond to these vibrations with varying results ranging from no perceptible effects at the low levels to slight damage at the highest levels. Table 2 gives approximate vibration levels for particular construction activities. This data provides a reasonable estimate for a wide range of soil conditions.

The City prohibits any uses that generate a discernible vibration impact beyond the property line. The nearest existing structure to the project site is located approximately 65-feet to the north of the project site. Due to the proximity of adjacent single-family detached residential dwelling units, project construction activities may result in ground borne vibration that is annoying but would be limited to activities within 100 feet of sensitive receptors and would only occur during site grading and preparation activities.

As shown in Table 2, the threshold at which there may be a risk of architectural damage to normal houses with plastered walls and ceilings is 0.20 PPV in/second. Primary sources of vibration during construction would be from bulldozers and

vibratory rollers. As shown in Table 2, a vibratory roller could produce a PPV of 0.21 inch per second at 25 feet and a large bulldozer could produce up to 0.089 PPV at 25 feet.

Use of vibratory equipment within 25 feet of adjacent residential structures and improvements could result in structural damage. Caution should be utilized if large equipment is utilized within 10 feet of property line. Mitigation measures to reduce potential impacts to structures are presented in Section VII of this report. Annoyance related impacts would be short-term and would only occur during site grading and preparation activities.

**Table 5****Typical Construction Equipment Noise Levels<sup>1</sup>**

| Type of Equipment    | Range of Maximum Sound Levels Measured (dBA at 50ft.) | Suggested Maximum Sound Levels for Analysis (dBA at 50ft.) |
|----------------------|---|--|
| Rock Drills          | 83-99   | 96   |
| Jack Hammers         | 75-85   | 82   |
| Pneumatic Tools      | 78-88   | 85   |
| Pumps                | 74-84   | 80   |
| Dozers               | 77-90   | 85   |
| Scrappers            | 83-91   | 87   |
| Haul Trucks          | 83-94   | 88   |
| Cranes               | 79-86   | 82   |
| Portable Generators  | 71-87   | 80   |
| Rollers              | 75-82   | 80   |
| Tractors             | 77-82   | 80   |
| Front-End Loaders    | 77-90   | 86   |
| Hydraulic Excavators | 81-90   | 86   |
| Graders              | 79-89   | 86   |

Figure 5

Project Operational Noise Levels Without Mitigation

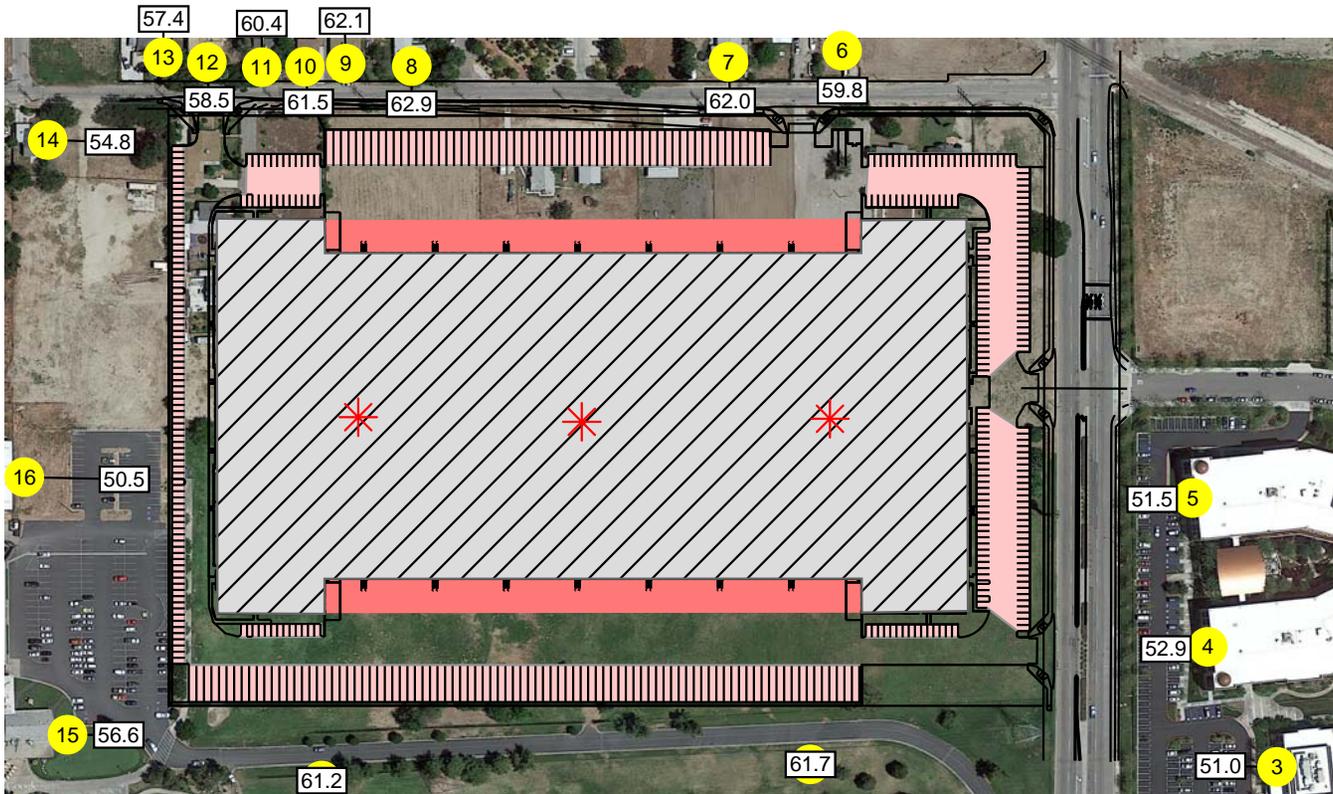

Peak Hour Noise Levels are shown in the boxes adjacent to the yellow receiver locations.

CNELs are expected to range:

62-70 at the residences located north and west of the project site;

57-68 at the adjacent golf course facilities; and

58-60 at the office buildings located east of the project site.

## **VI. Measures to Reduce Impacts**

---

### **A. Construction Mitigation Measures**

In addition to adherence to the City of San Bernardino and policies found in the Noise Element and Municipal Code limiting the construction hours of operation, the following measures are recommended to reduce construction noise and vibrations, emanating from the proposed project:

1. During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.
2. The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.
3. Equipment shall be shut off and not left to idle when not in use.
4. The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.
5. The project proponent shall mandate that the construction contractor prohibit the use of music or sound amplification on the project site during construction.
6. The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment.
7. Limit the use of heavy equipment or vibratory rollers and soil compressors along the project boundaries to the greatest degree possible. It is acknowledged that some soil compression may be necessary along the project boundaries.
8. Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.
9. For the duration of construction activities, the construction manager shall serve as the contact person should noise levels become disruptive to local residents. A sign should be posted at the project site with the contact phone number.

### **B. Operational Mitigation Measures**

1. The project shall construct an 8-foot noise barrier along the northern project boundary as shown on Figure 6. The wall shall be positioned at the top of slope or pad, whichever is greater such that it provides optimum sound attenuation.

**APPENDIX B**

**Definitions of Acoustical Terms**

| Term  | Definition   |
|---|--|
| Decibel, dB   | A logarithmic unit of noise level measurement that relates the energy of a noise source to that of a constant reference level; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.  |
| Frequency, Hertz  | In a function periodic in time, the number of times that the quantity repeats itself in one second (i.e., the number of cycles per second).  |
| A-Weighted Sound Level, dBA   | The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear.  |
| Root Mean Square (RMS)  | A measure of the magnitude of a varying noise source quantity. The name derives from the calculation of the square root of the mean of the squares of the values. It can be calculated from either a series of lone values or a continuous varying function.                   |
| Fast/Slow Meter Response  | The fast and slow meter responses are different settings on a sound level meter. The fast response setting takes a measurement every 100 milliseconds, while a slow setting takes one every second.  |
| L <sub>02</sub> , L <sub>08</sub> , L <sub>50</sub> , L <sub>90</sub> | The A-weighted noise levels that are equaled or exceeded by a fluctuating sound level, 2 percent, 8 percent, 50 percent, and 90 percent of a stated time period, respectively.   |
| Equivalent Continuous Noise Level, L <sub>eq</sub>                    | A level of steady state sound that in a stated time period, and a stated location, has the same A-weighted sound energy as the time-varying sound.   |
| L <sub>max</sub> , L <sub>min</sub>                                   | L <sub>max</sub> is the RMS (root mean squared) maximum level of a noise source or environment measured on a sound level meter, during a designated time interval, using fast meter response. L <sub>min</sub> is the minimum level.   |
| Ambient Noise Level   | The all-encompassing noise environment associated with a given environment, at a specified time, usually a composite of sound from many sources, at many directions, near and far, in which usually no particular sound is dominant.   |
| Offensive/ Offending/ Intrusive Noise                                 | The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of sound depends on its amplitude, duration, frequency, and time of occurrence, and tonal information content as well as the prevailing ambient noise level. |

## I. EXECUTIVE SUMMARY

---

The purpose of this report is to provide an assessment of the traffic impacts resulting from the development of the proposed Waterman Industrial Center project, and to identify the traffic mitigation measures necessary to maintain the established level of service standard for the elements of the impacted roadway system. The traffic issues related to the proposed land use and development have been evaluated in the context of the California Environmental Quality Act.

The City of San Bernardino is the lead agency responsible for preparation of the traffic impact analysis, in accordance with California Environmental Quality Act authorizing legislation. This report analyzes traffic impacts for the Existing Plus Project, the anticipated opening date with full occupancy of the development in Year 2017 at which time it will be generating trips at its full potential, and for the Year 2035.

Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with those terms unique to transportation engineering, a glossary of terms is provided in Appendix A.

### A. Analysis Methodology

A series of scoping discussions were conducted with the City of San Bernardino to define the desired analysis locations for each future analysis year. The project scoping agreement with the City of San Bernardino is included in Appendix B.

The analysis of the traffic impacts from the proposed development and the assessment of the required mitigation measures were based on an evaluation of the existing and forecast traffic conditions in the vicinity of the site with and without the project. The following analysis years are considered in this report:

- Existing Conditions (2015)
- Existing Plus Project<sup>1</sup> Conditions
- Existing Plus Ambient Growth (2017)                      Baseline Without Other Projects
- Opening Year (2017) Without Project                      With Cumulative Projects
- Opening Year (2017) With Project                      With Cumulative Projects
- Horizon Year Conditions (2035) Without Project
- Horizon Year Conditions (2035) With Project

The roadway elements that must be analyzed are dependent on both the analysis year (project Opening Year or Year 2035) and project generated trips. The identification of the study area, and the intersections and highway segments requiring analysis, was based on an estimate of the two-way traffic volumes on the roadway segments near the project site. All arterial segments have been included in the analysis when the anticipated project volume

---

<sup>1</sup> The existing plus project conditions has been analyzed to comply with the Sunnyvale West Neighborhood Association v. City of Sunnyvale CEQA court case. This scenario assumes the full development of the proposed project and full absorption of the proposed project trips on the circulation system at the present time. This scenario is provided for informational purposes only, and will not be used for impact determinations or mitigation.

equals or exceeds 50 two-way trips in the peak hours. The requirement is 100 two-way peak hour trips for freeways.

The project does not contribute trips greater than the freeway threshold volume of 100 two-way peak hour trips. The project does not contribute trips greater than the arterial link threshold volume of 50 two-way trips in the peak hours on intersections outside the City of San Bernardino.

**B. Definition of Deficiency and Significant Impact**

The following definitions of deficiencies and significant impacts have been developed in accordance with the City of San Bernardino requirements.

1. Definition of Deficiency

The definition of an intersection deficiency has been obtained from the City of San Bernardino General Plan. The General Plan states that peak hour intersection operations of Level of Service D or better are generally acceptable. Therefore, any intersection operating Level of Service E to F will be considered deficient.

For freeway facilities, the definition of deficiency is based on maintaining a level of service standard of Level of Service E or better, except where an existing Level of Service F condition is identified. A deficiency is, therefore, defined as any freeway segment operating or projected to operate at Level of Service F, unless the segment is currently identified.

2. Definition of Significant Impact

Based on the City of San Bernardino Development Services Department, Traffic Impact Study Guidelines (2015), the impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |                 |                      |
|--|-----------------|----------------------|
| Level of Service                               | Volume/Capacity | Incremental Increase |
| C  | 0.71-0.80       | 0.04 or more         |
| D  | 0.81-0.90       | 0.02 or more         |
| E/F  | 0.91 - more     | 0.01 or more         |

An intersection mitigation measure shall either fix the deficiency, or reduce the volume to capacity ratio so that it is below the level that occurs without the project.

A traffic impact is considered significant if the project both: i) contributes measurable traffic to and ii) substantially and adversely changes the level of service at any off-site location projected to experience deficient operations under foreseeable cumulative conditions, where feasible improvements consistent with the City of San Bernardino General Plan cannot be constructed.

**C. Project Description**

The proposed development is located on the southwest corner of the Waterman Avenue at Dumas Street intersection in the City of San Bernardino. A vicinity map showing the project location is provided on Figure 1.

The approximately 25 acre project site is proposed to be developed with 564,652 square feet of high-cube warehouse distribution center. The proposed project will have access to Waterman Avenue and Dumas Street. Figure 2 illustrates the project site plan.

**D. Existing Conditions**

The study area intersections currently operate at an acceptable Level of Service during the peak hours for existing traffic conditions.

**E. Project Traffic**

Project traffic volumes for all future projections were estimated using the manual approach. Trip generation has been estimated based on the Institute of Transportation Engineers, Trip Generation Manual, 9th Edition, 2012 and City of Fontana, Truck Trip Generation Study, August 2003 as well as the South Coast Air Quality Management District truck vehicle mix, January 2015.

Using the Fontana Study vehicle mix, the proposed development is projected to generate approximately 1,282 daily vehicle trips in Passenger Car Equivalents, 87 Passenger Car Equivalents of which will occur during the morning peak hour and 95 Passenger Car Equivalents of which will occur during the evening peak hour.

Using the South Coast Air Quality Management District vehicle mix, the proposed development is projected to generate approximately 1,569 daily vehicle trips in Passenger Car Equivalents, 110 Passenger Car Equivalents of which will occur during the morning peak hour and 116 Passenger Car Equivalents of which will occur during the evening peak hour.

To provide a more conservative analysis the South Coast Air Quality Management District trip generation values are used in the analysis for this report.

To determine the trip distributions for the proposed project, peak hour traffic counts of the existing directional distribution of traffic for existing areas in the vicinity of the site, and other additional information on future development and traffic impacts in the area were reviewed.

**F. Future Conditions**

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, with improvements (see Table 5).

As shown in Table 6 for Existing Plus Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Ambient Growth traffic conditions without and with improvements (see Table 7).

For Existing Plus Ambient Growth traffic conditions, a traffic signal is projected to be warranted at the following study area intersection (see Appendix G):

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (2014 Edition).

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) Without Project traffic conditions without and with improvements (see Table 8).

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, with improvements (see Table 9).

As shown in Table 10 for Opening Year (2017) With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 Without Project traffic conditions without and with improvements (see Table 11).

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, with improvements (see Table 12).

As shown in Table 13 for Year 2035 With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

**G. Recommendations**

The recommendations in this section address on-site improvements, off-site improvements and the phasing (as needed) of all necessary study area transportation improvements.

Improvements to the Waterman Road and Park Center Circle North intersection adjacent to the project are project related and the applicant will be responsible for construction these improvements.

1. On-Site Improvements

On-site improvements and improvements adjacent to the site will be required in conjunction with the proposed development to ensure adequate circulation within the project itself (see Figure 40).

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development, as necessary.

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development, as necessary.

Install traffic signal at Waterman Avenue and Park Center Circle North including Waterman Avenue northbound left turn lane improvements. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

2. Off-Site Improvements

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

Figure 1  
Project Location Map

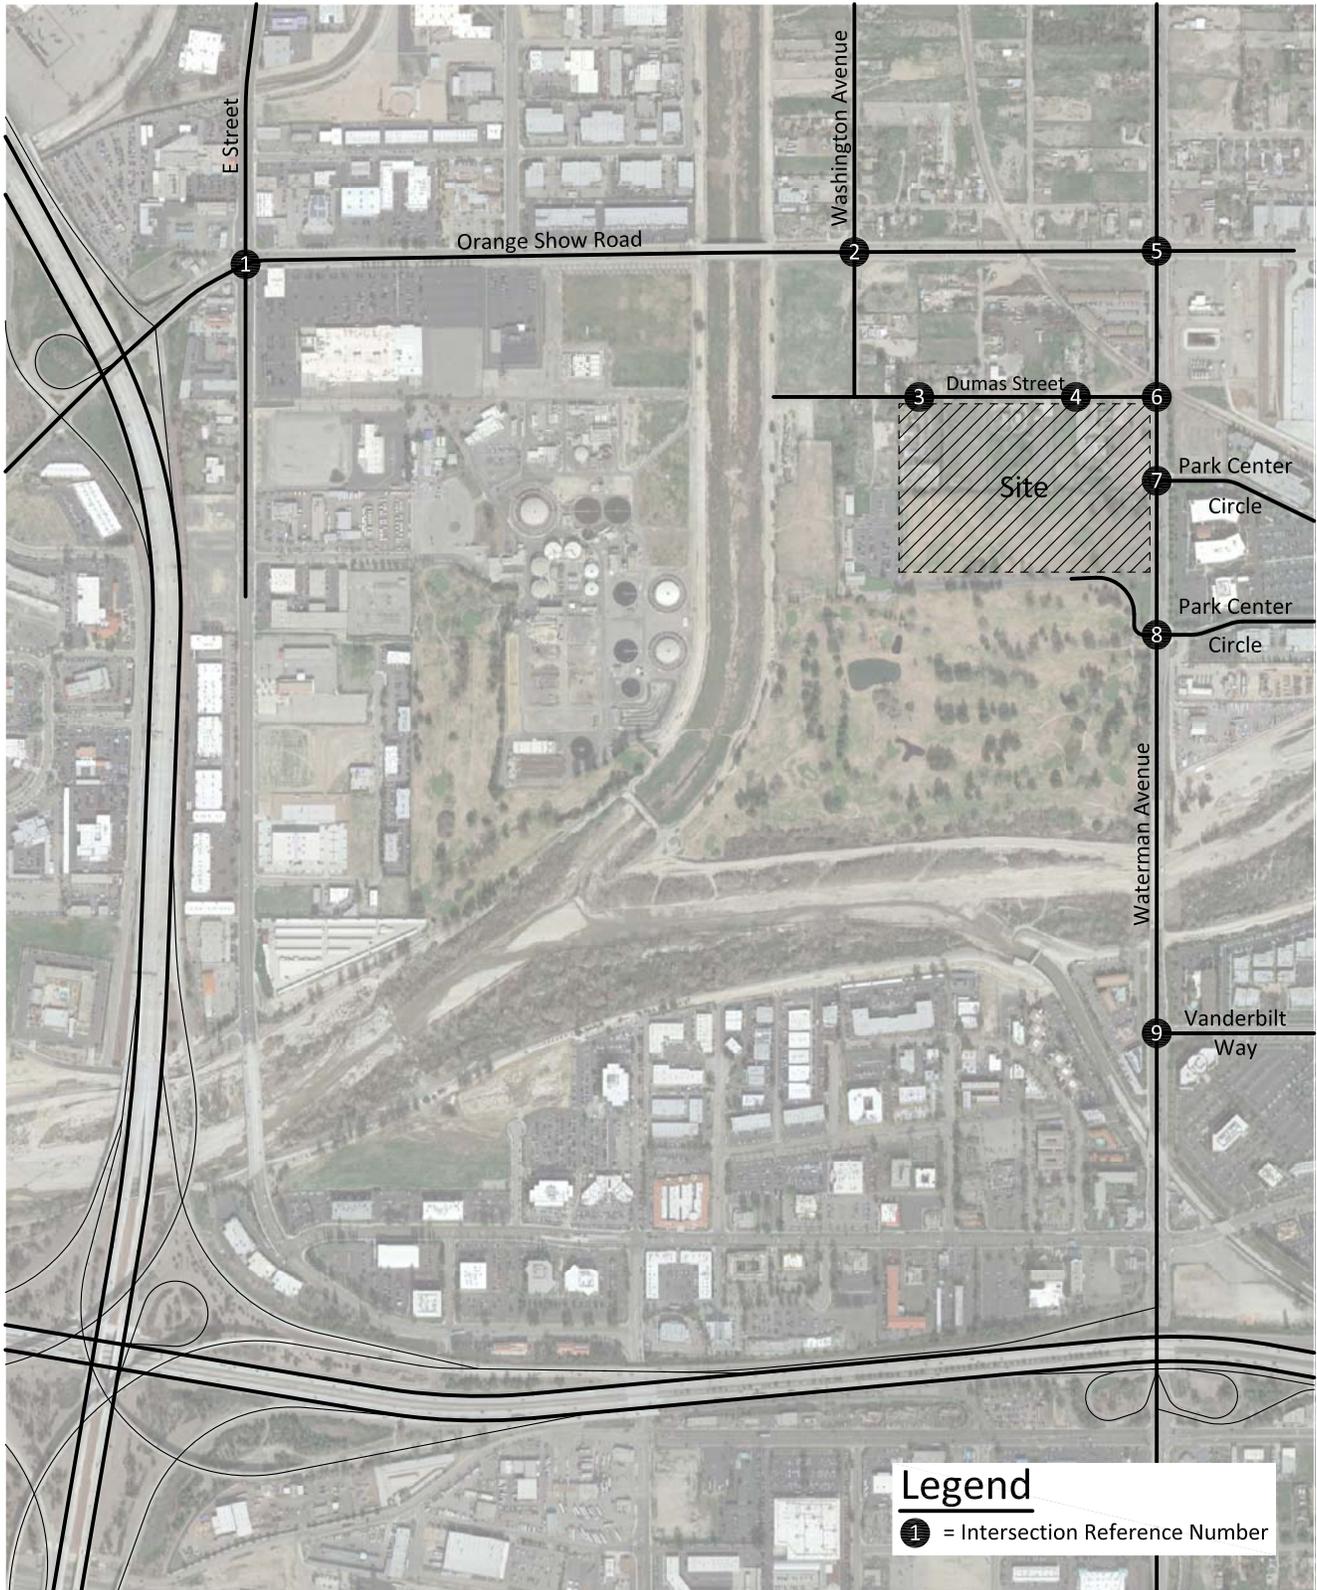

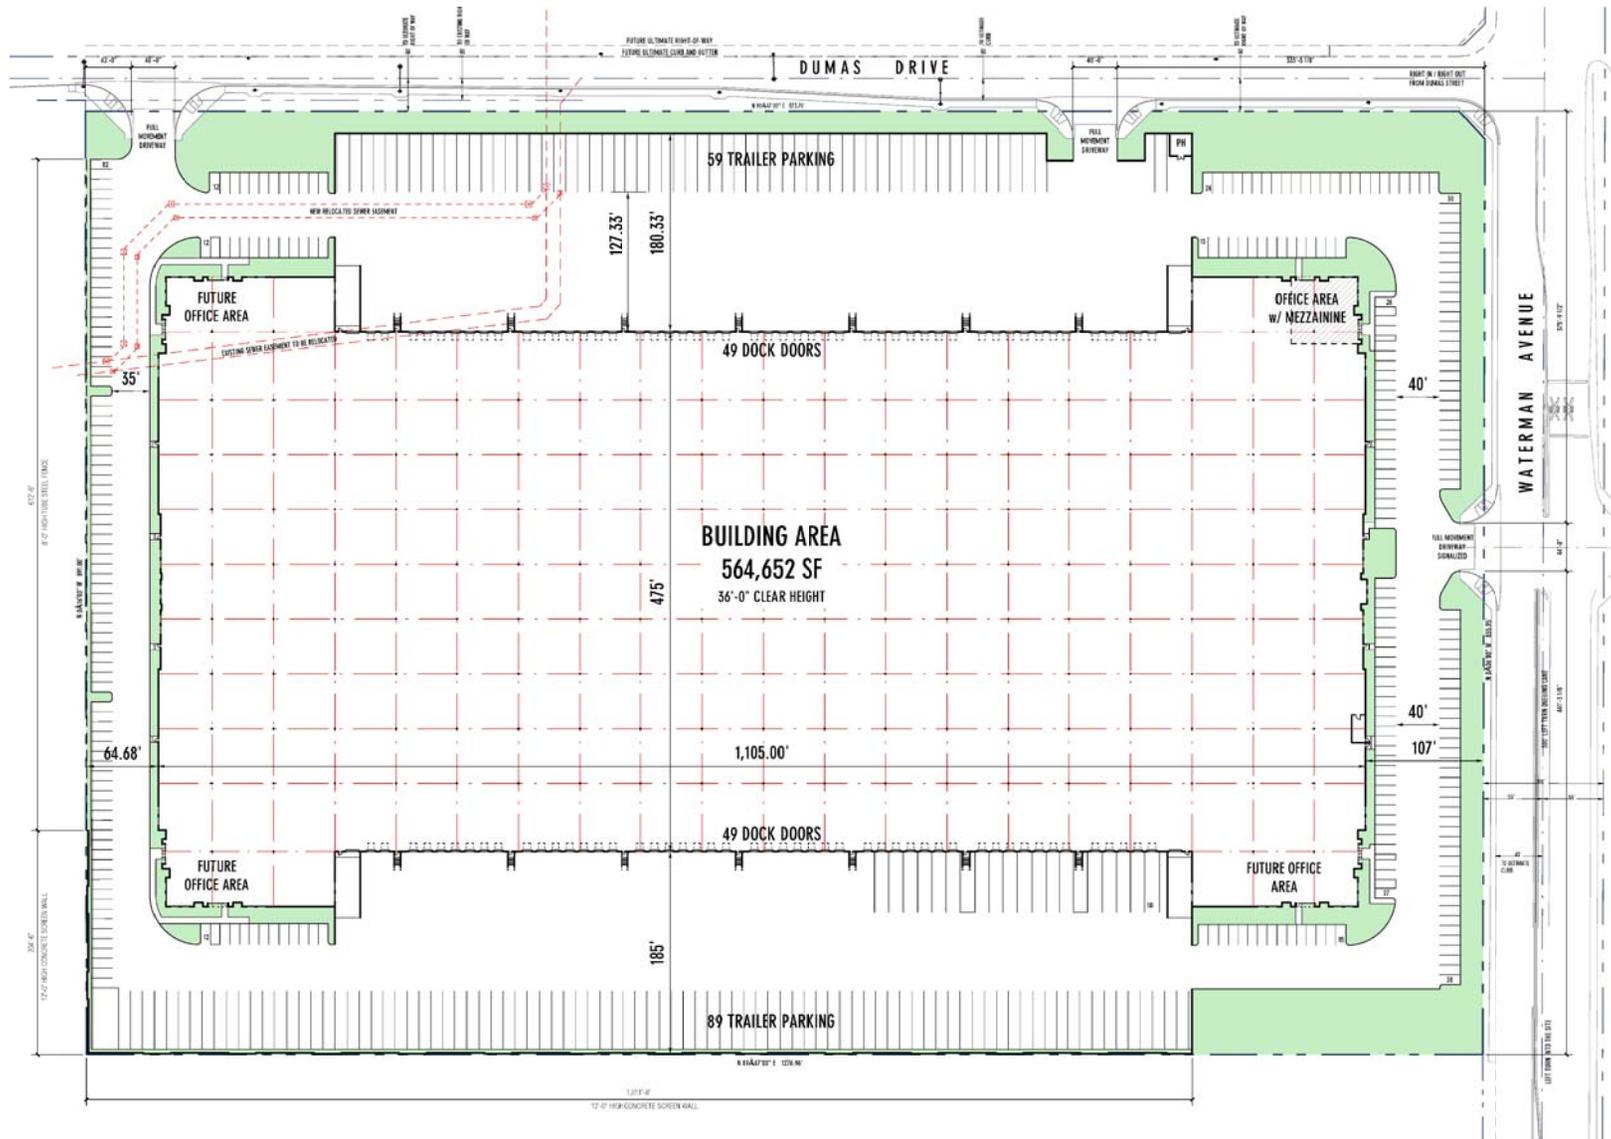

Figure 2  
Site Plan

## II. EXISTING CONDITIONS

---

### A. Existing Roadway System

Figure 3 identifies the existing conditions for study area roadways. The number of through lanes for existing roadways and the existing intersection controls are identified.

Local access is provided by various roadways in the vicinity of the site. The east-west roadways which will be most affected by the project include Orange Show Road, Dumas Street, Park Center Circle, and Vanderbilt Way. North-south roadways expected to provide local access include E Street, Washington Avenue, and Waterman Avenue.

### B. Existing Volumes

Figure 4 depicts the existing average daily traffic volumes. The existing average daily traffic volumes were factored from peak hour counts in Passenger Car Equivalent's (see Appendix C) obtained by Kunzman Associates, Inc. using the following formula for each intersection leg:

$$\text{PM Peak Hour (Approach + Exit Volume)} \times 11.5 = \text{Daily Leg Volume.}$$

This is a conservative estimate and may overestimate the average daily traffic volumes.

Existing intersection traffic conditions were established through morning and evening peak hour traffic counts obtained by Kunzman Associates, Inc. from August 2015 (see Appendix C). In addition, truck classification counts were conducted at the study area intersections. The existing volumes and types (number of axles) of trucks was used in the conversion of trucks to Passenger Car Equivalent's. The truck trips were converted using the following factors: 2 axle trucks = 2.0, 3 axle trucks = 2.5, and 4+ axle trucks = 3.0. The resulting Passenger Car Equivalents are shown on Figures 5 and 6, respectively. Explicit peak hour factors have been calculated using the data collected for this effort as well. The morning and evening peak hour traffic volumes were identified by counting the two-hour periods from 7:00 AM – 9:00 AM and 4:00 PM – 6:00 PM.

### C. Existing Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix F) based on the 2010 Highway Capacity Manual – Transportation Research Board Special Report 209. To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection. The signalized intersections are considered deficient (Level of Service F) if the overall intersection critical volume to capacity ratio equals or exceeds 1.0, even if the level of service defined by the delay value is below the defined Level of Service standard. The volume to capacity ratio is defined as the critical volumes divided by the intersection capacity. A volume to capacity ratio greater than 1.0 implies an infinite queue.

The Level of Service analysis for signalized intersections has been performed using optimized signal timing. This analysis has included an assumed lost time of two seconds per phase. Signal timing optimization has considered pedestrian safety and signal coordination requirements. Appropriate time for pedestrian crossings has also been considered in the signalized intersection analysis. The following formula has been used to calculate the pedestrian minimum times for all Highway Capacity Manual runs:

$$(\text{Curb to curb distance}) / (3.5 \text{ feet/second}) + 7 \text{ seconds.}$$

For existing/Existing Plus Project/and Opening Year traffic conditions, saturation flow rates of 1,800 vehicles per hour of green for through and right turn lanes and 1,700 vehicles per lane for single left turn lanes, 1,600 vehicles per lane for dual left turn lanes and 1,500 vehicles per lane for triple left turn lanes have been assumed for the capacity analysis.

For Year 2035 traffic conditions, saturation flow rates of 1,900 vehicles per hour of green for through and right turn lanes and 1,800 vehicles per lane for single left turn lanes, 1,700 vehicles per lane for dual left turn lanes and 1,800 vehicles per lane for double right turn lanes have been assumed for the capacity analysis.

The peak hour traffic volumes have been adjusted to peak 15 minute volumes for analysis purposes using the existing observed peak 15 minute to peak hour factors (see Appendix C). The Year 2035 peak hour factor has been adjusted to 0.95. This is to account for the effects of congestion on peak spreading. Peak spreading refers to the tendency of traffic to spread more evenly across time as congestion increases.

The existing delay and Level of Service for intersections in the vicinity of the project are shown in Table 1. The study area intersections currently operate at an acceptable Level of Service during the peak hours for existing traffic conditions. Existing delay worksheets are provided in Appendix F.

**D. Planned Transportation Improvements and Relationship to General Plan**

The City of San Bernardino General Plan Circulation Element is shown on Figure 7. Both existing and future roadways are included in the Circulation Element of the General Plan and are graphically depicted on Figure 7. This figure shows the nature and extent of arterial highways that are needed to adequately serve the ultimate development depicted by the land use element of the General Plan. The City of San Bernardino General Plan roadway cross-sections are illustrated on Figure 8.

**E. Transit Service**

Figure 9 depicts the San Bernardino Bus Transit System Map. Transit service is provided by Omnitrans. Transit Route 5 operates on Waterman Avenue, and Transit Routes 2 and 15 operate on E Street.

**F. Bicycle and Pedestrian Facilities**

The City of San Bernardino designated bike paths are illustrated on Figure 10 and the existing pedestrian facilities adjacent to the project are shown in Figure 11.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. For a de facto right turn lane ( d ) to function as a right turn lane, there must be sufficient width for right turning vehicles to pass on the right of the through travel lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane, <1> = Shared Left, Through & Right Lane.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay and level of service has been calculated using the following analysis software: Vistro, Version 4.00-00. Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

OVER 40 YEARS OF EXCELLENT SERVICE

### III. PROJECT TRIPS

---

#### A. Project Description

The approximately 25 acre project site is proposed to be developed with 564,652 square feet of high-cube warehouse distribution center. The proposed project will have access to Waterman Avenue and Dumas Street.

#### B. Trip Generation

The trips generated by the project are determined by multiplying an appropriate trip generation rate by the quantity of land use. Trip generation rates are predicated on the assumption that energy costs, the availability of roadway capacity, the availability of vehicles to drive, and life styles remain similar to what are known today. A major change in these variables may affect trip generation rates.

Trip generation rates were determined for daily traffic and morning peak hour inbound and outbound traffic, and evening peak hour inbound and outbound traffic for the proposed land use. By multiplying the trip generation rates by the land use quantity, the traffic volumes are determined. Table 2 shows the project trip generation based upon rates obtained from the Institute of Transportation Engineers, Trip Generation Manual, 9th Edition, 2012 and City of Fontana, Truck Trip Generation Study, August 2003. Table 3 shows a trip generation comparison using the South Coast Air Quality Management District truck vehicle mix, January 2015, compared to the Fontana vehicle mix

Using the Fontana Study vehicle mix, the proposed development is projected to generate approximately 1,282 daily vehicle trips in Passenger Car Equivalents, 87 Passenger Car Equivalents of which will occur during the morning peak hour and 95 Passenger Car Equivalents of which will occur during the evening peak hour.

Using the South Coast Air Quality Management District vehicle mix, the proposed development is projected to generate approximately 1,569 daily vehicle trips in Passenger Car Equivalents, 110 Passenger Car Equivalents of which will occur during the morning peak hour and 116 Passenger Car Equivalents of which will occur during the evening peak hour.

To provide a more conservative analysis the South Coast Air Quality Management District trip generation values are used in the analysis for this report.

#### C. Trip Distribution

Figures 12 and 13 contain the directional distributions of the project trips for the proposed land use. To determine the trip distributions for the proposed project, peak hour traffic counts of the existing directional distribution of traffic for existing areas in the vicinity of the site, and other additional information on future development and traffic impacts in the area were reviewed.

**D. Trip Assignment**

Based on the identified trip generation and distributions, project average daily traffic volumes have been calculated and shown on Figure 14. Morning and evening peak hour intersection turning movement volumes expected from the project are shown on Figures 15 and 16, respectively.

**E. Traffic Contribution Test**

No analysis is required further than 5 miles from the project site. The roadway elements that must be analyzed are dependent on both the analysis year (project Opening Year or Year 2035) and project generated trips. The identification of the study area, and the intersections and highway segments requiring analysis, was based on an estimate of the two-way traffic volumes on the roadway segments near the project site. All arterial segments have been included in the analysis when the anticipated project volume equals or exceeds 50 two-way trips in the peak hours. The requirement is 100 two-way peak hour trips for freeways. Figure 17 graphically depicts the project traffic contribution test volumes on all of the roadway segments adjacent to the potential intersection analysis locations until the project volume contribution has clearly dropped below the 50 trip threshold.

The project does not contribute trips greater than the freeway threshold volume of 100 two-way peak hour trips. The project does not contribute trips greater than the arterial link threshold volume of 50 two-way trips in the peak hours on intersections outside of the City of San Bernardino.

**Table 2**

**Proposed Project Trip Generation Based on Fontana Vehicle Mix<sup>1</sup>**

| Land Use                     | Quantity       | Units <sup>2</sup> | PCE<br>Factor <sup>3</sup> | Vehicle<br>Percent <sup>4</sup> | Peak Hour |           |           |           |           |           | Daily        |

## IV. FUTURE CONDITIONS

---

To assess future traffic conditions, existing traffic is combined with ambient growth, other development, and project traffic. The opening year for analysis purposes in this report is 2017. The horizon year is 2035.

### A. Method of Projection

#### 1. Ambient Growth Opening Year

To account for ambient growth on roadways, Opening Year (2017) traffic volumes have been interpolated from the Year 2035 traffic volumes based upon a proportion of the future growth increment from the San Bernardino Transportation Analysis Model (SBTAM) traffic model Year 2008 and Year 2035 average daily traffic volume forecasts (see Appendix D). The SBTAM traffic model plots are included in Appendix E.

#### 2. Other Development

Potential developments within 1.5 mile radius of the study area are included in the analysis if they are not currently built, they are approved, their approval has not expired, and they would contribute trips to the study area intersections.

Table 4 lists the proposed land uses for the other developments (see Figure 18), and shows the daily and peak hour vehicle trips generated by the other development in the study area.

Based on the identified trip generation and distributions, other development average daily traffic volumes have been calculated and shown on Figure 19. Figures 20 and 21 shows the other development morning and evening peak hour intersection turning movement volumes, respectively.

#### 3. Opening Year Traffic Conditions

To assess Opening Year traffic conditions, existing traffic is combined with ambient growth, and other development traffic. The opening year for analysis purposes in this report is 2017.

#### 4. Horizon Year Traffic Conditions

The average daily traffic volume forecasts have been determined using the growth increment approach on the San Bernardino Transportation Analysis Model (SBTAM) traffic model Year 2008 and Year 2035 average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 27 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2015 and Year 2035. For this purpose, linear growth between the Year 2008 base condition and the forecast Year 2035 condition was

assumed. Since the increment between Year 2015 and Year 2035 is 20 years of the 27 year time frame, a factor of 0.74 (i.e., 20/27) was used.

The Year 2035 Without Project daily and peak hour directional roadway segment volume forecasts have been determined using the growth increment approach on the SBTAM traffic model Year 2008 and Year 2035 peak hour volumes. The SBTAM traffic model plots are included in Appendix E. Current peak hour intersection approach/departure data is a necessary input to this approach. The existing traffic count data serves as both the starting point for the refinement process, and also provides important insight into current travel patterns and the relationship between peak hour and daily traffic conditions. The initial turning movement proportions are estimated based upon the relationship of each approach leg's forecast traffic volume to the other legs forecast volumes at the intersection. The initial estimate of turning movement proportions is then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program Report 255. A linear programming algorithm is used to calculate individual turning movements that match the known directional roadway segment volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

Project traffic volumes were then added to the Year 2035 SBTAM traffic model volumes. Quality control checks and forecast adjustments were performed as necessary to ensure that all future traffic volume forecasts reflect a minimum of 10% growth over existing traffic volumes. The result of this traffic forecasting procedure is a series of traffic volumes suitable for traffic operations analysis.

## **B. Average Daily Traffic Volumes**

### **1. Existing Plus Project**

The average daily traffic volumes for Existing Plus Project traffic conditions have been determined. Existing Plus Project average daily traffic volumes are shown on Figure 22.

### **2. Existing Plus Ambient Growth**

The average daily traffic volumes for Existing Plus Ambient Growth traffic conditions have been determined as described above using the growth interpolation process (see Section IV.A). Existing Plus Ambient Growth average daily traffic volumes are shown on Figure 23.

### **3. Opening Year (2017) Without Project**

The average daily traffic volumes for Opening Year (2017) Without Project traffic conditions have been determined as described above using the growth interpolation process (see Section IV.A). Opening Year (2017) Without Project average daily traffic volumes are shown on Figure 24.

4. Opening Year (2017) With Project

The average daily traffic volumes for Opening Year (2017) With Project traffic conditions have been determined as described above using the volume addition process (see Section IV.A). Opening Year (2017) With Project average daily traffic volumes are shown on Figure 25.

5. Year 2035 Without Project

The average daily traffic volumes for Year 2035 Without Project traffic conditions have been determined as described above using the growth increment process (see Section IV.A). Year 2035 Without Project average daily traffic volumes are shown on Figure 26.

6. Year 2035 With Project

The average daily traffic volumes for Year 2035 With Project traffic conditions have been determined as described above using the volume addition process (see Section IV.A). Year 2035 With Project average daily traffic volumes are shown on Figure 27.

**C. Intersection Level of Service**

Level of Service calculation worksheets are provided in Appendix F for all traffic condition scenarios.

1. Existing Plus Project

The Existing Plus Project delay and Level of Service for the study area roadway network are shown in Table 5. Table 5 shows delay values based on the geometrics at the study area intersections, without and with improvements. Existing Plus Project morning and evening peak hour intersection turning movement volumes are shown on Figures 28 and 29, respectively.

As shown in Table 5, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Project traffic conditions, with improvements.

Table 6 depicts the Existing Plus Project trip contribution at the study area intersections. As shown in Table 6 for Existing Plus Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

2. Existing Plus Ambient Growth

The Existing Plus Ambient Growth (2017) delay and Level of Service for the study area roadway network without other development or the proposed project are shown in Table 7. Table 7 shows delay values based on the existing geometrics at the study area intersections. Existing Plus Ambient Growth morning and evening peak hour intersection turning movement volumes are shown on Figures 30 and 31, respectively.

As shown in Table 7, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Existing Plus Ambient Growth traffic conditions.

3. Opening Year (2017) Without Project

The Opening Year (2017) delay and Level of Service for the study area roadway network without the proposed project are shown in Table 8. Table 8 shows delay values based on the geometrics at the study area intersections, without and with improvements. Opening Year (2017) Without Project morning and evening peak hour intersection turning movement volumes are shown on Figures 32 and 33, respectively.

As shown in Table 8, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) Without Project traffic conditions without and with improvements.

4. Opening Year (2017) With Project

The Opening Year (2017) delay and Level of Service for the study area roadway network with the proposed project are shown in Table 9. Table 9 shows delay values based on the geometrics at the study area intersections, without and with improvements. Opening Year (2017) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 34 and 35, respectively.

As shown in Table 9, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Opening Year (2017) With Project traffic conditions, with improvements

Table 10 depicts the Opening Year (2017) With Project trip contribution at the study area intersections. As shown in Table 10 for Opening Year (2017) With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

5. Year 2035 Without Project

The Year 2035 delay and Level of Service for the study area roadway network without the proposed project are shown in Table 11. Table 11 shows delay values based on the geometrics at the study area intersections, without and with improvements. Year 2035 Without Project morning and evening peak hour intersection turning movement volumes are shown on Figures 36 and 37, respectively.

As shown in Table 11, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 Without Project traffic conditions without and with improvements.

6. Year 2035 With Project

The Year 2035 delay and Level of Service for the study area roadway network with the proposed project are shown in Table 12. Table 12 shows delay values based on the geometrics at the study area intersections, without and with improvements. Year 2035 With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 38 and 39, respectively.

As shown in Table 12, the study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, except for the intersection, except for the following intersection which is projected to operate at an unacceptable Level of Service during the peak hours:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The study area intersections are projected to operate at an acceptable Level of Service during the peak hours for Year 2035 With Project traffic conditions, with improvements.

Table 13 depicts the Year 2035 With Project trip contribution at the study area intersections. As shown in Table 13 for Year 2035 With Project traffic conditions, the project generated trips result in a significant impact at the following study area intersection:

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

**D. Future Traffic Signal Warrant Analysis**

For Existing Plus Ambient Growth traffic conditions, a traffic signal is projected to be warranted at the following study area intersection (see Appendix G):

Waterman Avenue (NS) at:  
Park Center Circle N (EW) - #7

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (2014 Edition).

**E. Freeway Evaluation**

The project does not contribute trips greater than the freeway mainline threshold of 100 two-way trips.

As shown on Figure 17, the project site does not contribute (50) or more project related trips to the study area freeway ramp terminus of I-215 Freeway Ramps at Orange Show Avenue or Waterman Avenue and I-10 Freeway Ramps.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. For a de facto right turn lane ( d ) to function as a right turn lane, there must be sufficient width for right turning vehicles to pass on the right of the through travel lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane, <1> = Shared Left, Through & Right Lane, **Bold** = Improvement.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay and level of service has been calculated using the following analysis software: Vistro, Version 4.00-00. Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>5</sup> 99.9 - F = Delay high, intersection unstable, Level of Service F.

<sup>6</sup> **Bold** = Improvements to be constructed by the project.

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. For a de facto right turn lane ( d ) to function as a right turn lane, there must be sufficient width for right turning vehicles to pass on the right of the through travel lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane, <1> = Shared Left, Through & Right Lane, **Bold** = Improvement.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay and level of service has been calculated using the following analysis software: Vistro, Version 4.00-00. Per the 2010 [Highway Capacity Manual](#), overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>5</sup> Traffic signal is projected to be warranted.

Table 8

Opening Year 2017 Without Project Intersection Delay and Level of Service

| Intersection   | Jurisdiction | Traffic Control <sup>2</sup> | Intersection Approach Lanes <sup>1</sup> |     |     |            |     |     |           |     |     |           |     |    | Peak Hour          |                  |                  |                    |                  |                  |

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. For a de facto right turn lane ( d ) to function as a right turn lane, there must be sufficient width for right turning vehicles to pass on the right of the through travel lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane, <1> = Shared Left, Through & Right Lane, **Bold** = Improvement.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay and level of service has been calculated using the following analysis software: Vistro, Version 4.00-00. Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

Table 9

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. For a de facto right turn lane ( d ) to function as a right turn lane, there must be sufficient width for right turning vehicles to pass on the right of the through travel lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane, <1> = Shared Left, Through & Right Lane, **Bold** = Improvement.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay and level of service has been calculated using the following analysis software: Vistro, Version 4.00-00. Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

Table 12

Year 2035 With Project Intersection Delay and Level of Service

| Intersection   | Jurisdiction | Traffic Control <sup>2</sup> | Intersection Approach Lanes <sup>1</sup> |     |            |            |     |          |            |            |          |           |     |    | Peak Hour          |                  |                  |                    |                  |                  |

| Vanderbilt Way (EW) - #9                                 | City of SB   | TS                           | 1  | 2   | 1          | 1          | 2.5 | 0.5      | 0          | <1>        | 0        | 1.5       | 0.5 | 1  | 20.1               | C                | 0.720            | 34.3               | C                | 0.981            |

<sup>1</sup> When a right turn lane is designated, the lane can either be striped or unstriped. For a de facto right turn lane ( d ) to function as a right turn lane, there must be sufficient width for right turning vehicles to pass on the right of the through travel lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane, <1> = Shared Left, Through & Right Lane, **Bold** = Improvement.

<sup>2</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>3</sup> Delay and level of service has been calculated using the following analysis software: Vistro, Version 4.00-00. Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

<sup>4</sup> LOS = Level of Service; V/C = Volume to Capacity.

<sup>5</sup> 99.9 - F = Delay high, intersection unstable, Level of Service F.

<sup>6</sup> **Bold** = Improvements to be constructed by the project.

<sup>1</sup> TS = Traffic Signal; CSS = Cross Street Stop

<sup>2</sup> LOS = Level of Service

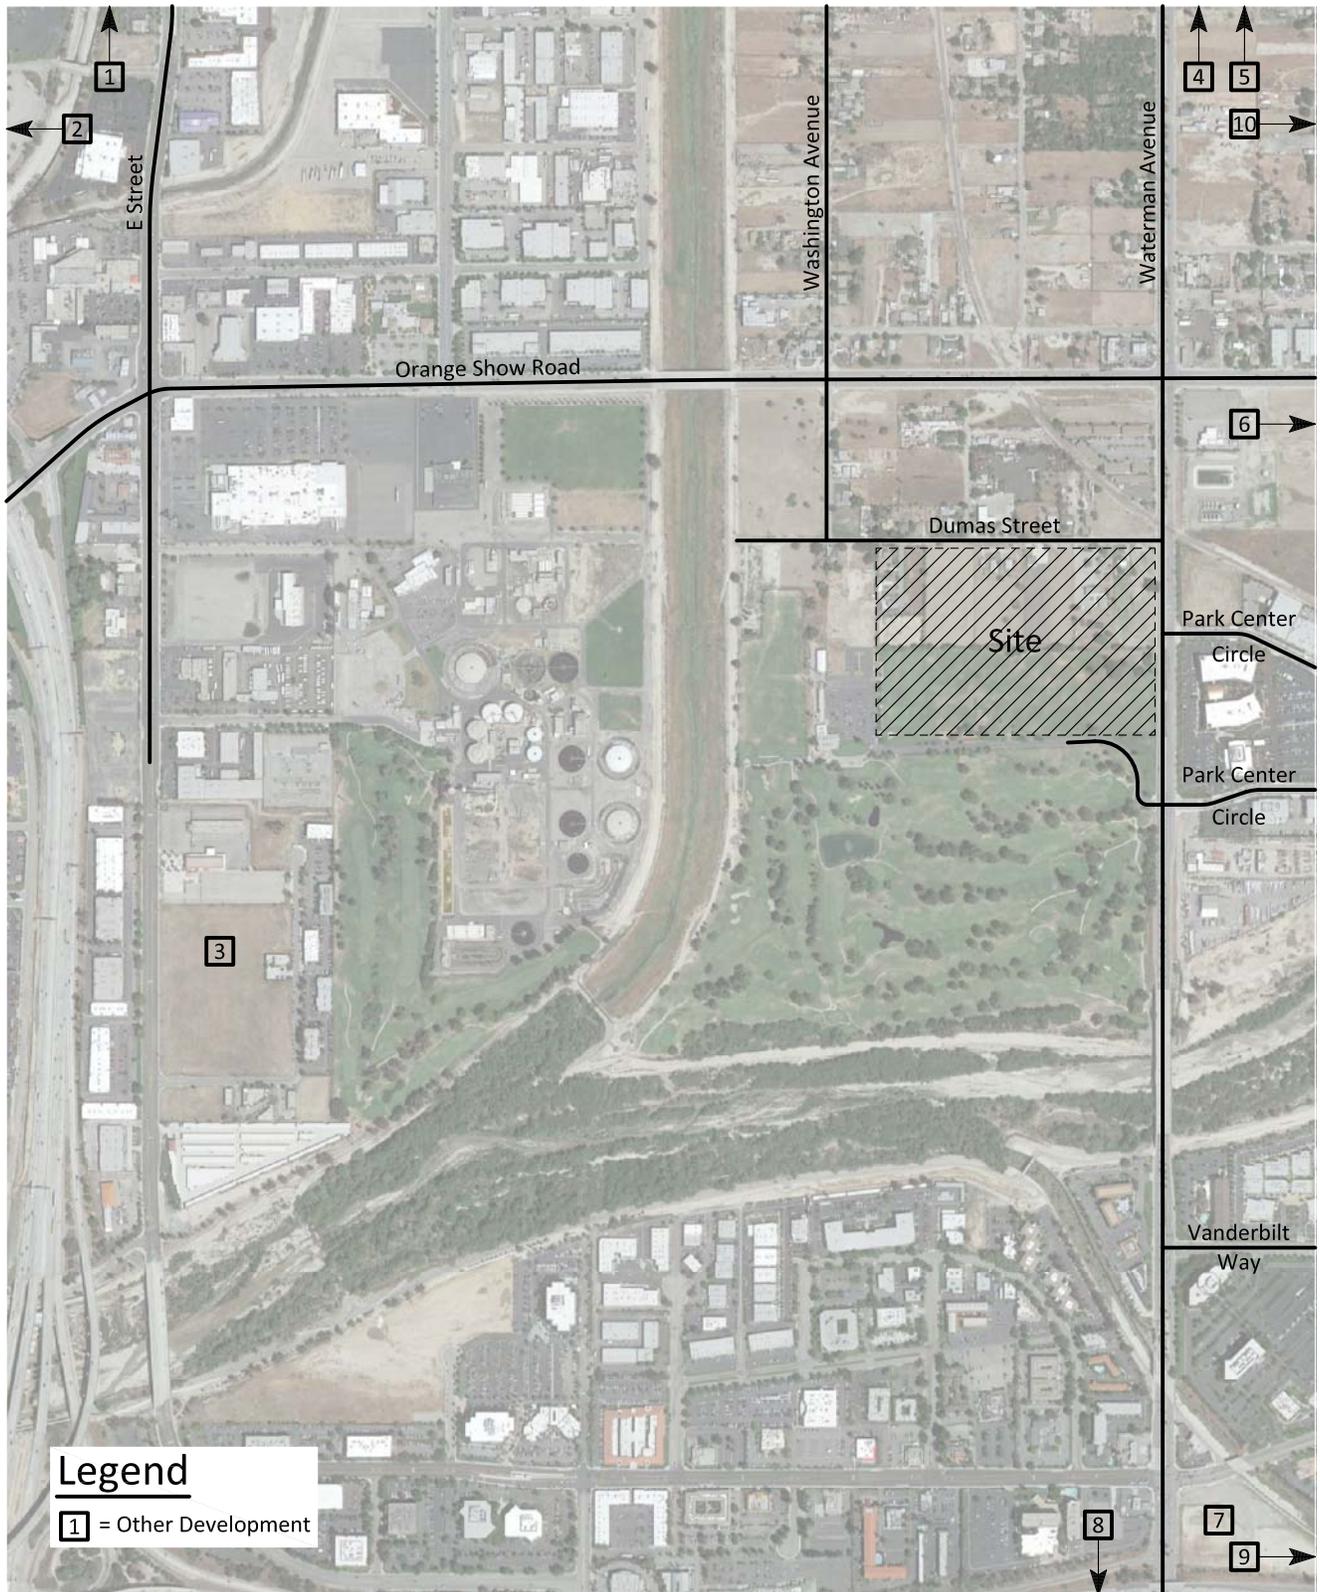

<sup>3</sup> V/C = Volume to Capacity

<sup>4</sup> For signalized intersections, an impact is considered significant if the project related increase in the volume to capacity ratio equals or exceeds the thresholds shown below:

| Significant Impact Threshold for Intersections |   |
|--|---|
| Level of Service Without Project               | Volume to Capacity Incremental Increase |
| C  | equal to or greater than 0.04 or more   |
| D  | equal to or greater than 0.02 or more   |
| E/F  | equal to or greater than 0.01 or more   |

<sup>5</sup> For unsignalized intersections, an impact is considered significant if the intersection operates at Level of Service E or worse.

## **V. CONCLUSIONS AND RECOMMENDATIONS**

---

The recommendations in this section address on-site improvements, off-site improvements and the phasing (as needed) of all necessary study area transportation improvements.

Improvements to the Waterman Road and Park Center Circle North intersection adjacent to the project are project related and the applicant will be responsible for construction these improvements.

### **A. On-Site Improvements**

On-site improvements and improvements adjacent to the site will be required in conjunction with the proposed development to ensure adequate circulation within the project itself (see Figure 40).

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including northbound left turn lane and southbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including eastbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

Install traffic signal at Waterman Avenue and Park Center Circle North. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

### **B. Off-Site Improvements**

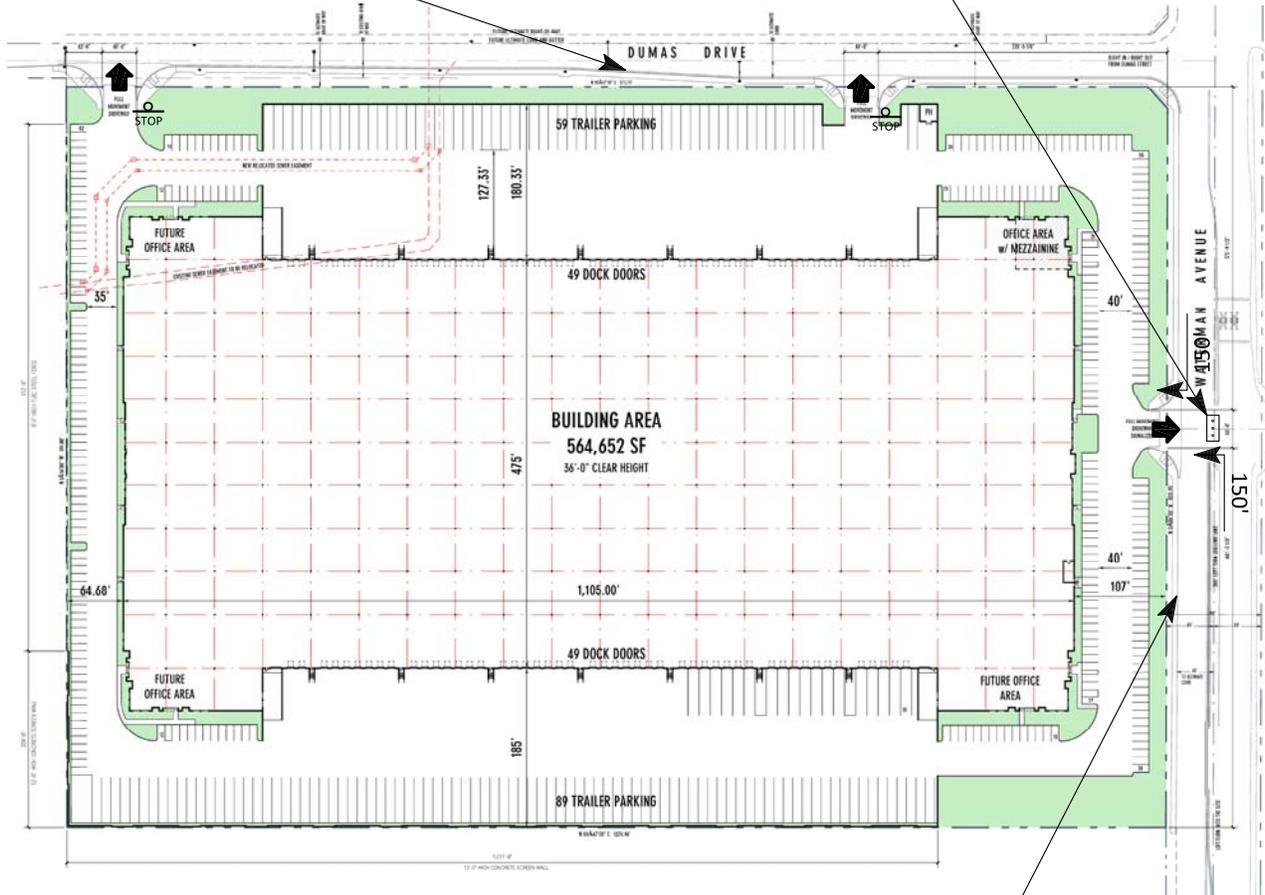

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

# Figure 40 Circulation Recommendations

Construct Dumas Street from the west project boundary to Waterman Avenue at its ultimate half-section width including eastbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

Install traffic signal at Waterman Avenue and Park Center Circle North. The traffic signals within the study area should include an interconnect of the traffic signals to function in a coordinated system.

Construct Waterman Avenue from Dumas Street to the south project boundary at its ultimate half-section width including northbound left turn lane and southbound right turn lane, landscaping and parkway improvements in conjunction with development, as necessary.

The project site should provide sufficient parking spaces to meet City of San Bernardino parking code requirements in order to service on-site parking demand.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

As is the case for any roadway design, the City of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to see if traffic operations are satisfactory.

### Legend

- = Traffic Signal
- = Stop Sign
- = Full Access Driveway
- = 150' = Left Turn Pocket Length
- = 150' = Right Turn Pocket Length

| ADT:      | Average Daily Traffic                   |
| Caltrans: | California Department of Transportation |
| DU:       | Dwelling Unit                           |
| ICU:      | Intersection Capacity Utilization       |
| LOS:      | Level of Service                        |
| TSF:      | Thousand Square Feet                    |
| V/C:      | Volume/Capacity                         |
| VMT:      | Vehicle Miles Traveled                  |

### TERMS

**AVERAGE DAILY TRAFFIC:** The total volume during a year divided by the number of days in a year. Usually only weekdays are included.

**BANDWIDTH:** The number of seconds of green time available for through traffic in a signal progression.

**BOTTLENECK:** A constriction along a travelway that limits the amount of traffic that can proceed downstream from its location.

**CAPACITY:** The maximum number of vehicles that can be reasonably expected to pass over a given section of a lane or a roadway in a given time period.

**CHANNELIZATION:** The separation or regulation of conflicting traffic movements into definite paths of travel by the use of pavement markings, raised islands, or other suitable means to facilitate the safe and orderly movements of both vehicles and pedestrians.

**CLEARANCE INTERVAL:** Nearly same as yellow time. If there is an all red interval after the end of a yellow, then that is also added into the clearance interval.

**CORDON:** An imaginary line around an area across which vehicles, persons, or other items are counted (in and out).

**CYCLE LENGTH:** The time period in seconds required for one complete signal cycle.

**CUL-DE-SAC STREET:** A local street open at one end only, and with special provisions for turning around.

**DAILY CAPACITY:** The daily volume of traffic that will result in a volume during the peak hour equal to the capacity of the roadway.

**DELAY:** The time consumed while traffic is impeded in its movement by some element over which it has no control, usually expressed in seconds per vehicle.

**DEMAND RESPONSIVE SIGNAL:** Same as traffic-actuated signal.

**DENSITY:** The number of vehicles occupying in a unit length of the through traffic lanes of a roadway at any given instant. Usually expressed in vehicles per mile.

**DETECTOR:** A device that responds to a physical stimulus and transmits a resulting impulse to the signal controller.

**DESIGN SPEED:** A speed selected for purposes of design. Features of a highway, such as curvature, superelevation, and sight distance (upon which the safe operation of vehicles is dependent) are correlated to design speed.

**DIRECTIONAL SPLIT:** The percent of traffic in the peak direction at any point in time.

**DIVERSION:** The rerouting of peak hour traffic to avoid congestion.

**FORCED FLOW:** Opposite of free flow.

**FREE FLOW:** Volumes are well below capacity. Vehicles can maneuver freely and travel is unimpeded by other traffic.

**GAP:** Time or distance between successive vehicles in a traffic stream, rear bumper to front bumper.

**HEADWAY:** Time or distance spacing between successive vehicles in a traffic stream, front bumper to front bumper.

**INTERCONNECTED SIGNAL SYSTEM:** A number of intersections that are connected to achieve signal progression.

**LEVEL OF SERVICE:** A qualitative measure of a number of factors, which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operating costs.

**LOOP DETECTOR:** A vehicle detector consisting of a loop of wire embedded in the roadway, energized by alternating current and producing an output circuit closure when passed over by a vehicle.

**MINIMUM ACCEPTABLE GAP:** Smallest time headway between successive vehicles in a traffic stream into which another vehicle is willing and able to cross or merge.

**MULTI-MODAL:** More than one mode; such as automobile, bus transit, rail rapid transit, and bicycle transportation modes.

**OFFSET:** The time interval in seconds between the beginning of green at one intersection and the beginning of green at an adjacent intersection.

**PLATOON:** A closely grouped component of traffic that is composed of several vehicles moving, or standing ready to move, with clear spaces ahead and behind.

**ORIGIN-DESTINATION SURVEY:** A survey to determine the point of origin and the point of destination for a given vehicle trip.

**PASSENGER CAR EQUIVALENTS (PCE):** One car is one Passenger Car Equivalent. A truck is equal to 2 or 3 Passenger Car Equivalents in that a truck requires longer to start, goes slower, and accelerates slower. Loaded trucks have a higher Passenger Car Equivalent than empty trucks.

**PEAK HOUR:** The 60 consecutive minutes with the highest number of vehicles.

**PRETIMED SIGNAL:** A type of traffic signal that directs traffic to stop and go on a predetermined time schedule without regard to traffic conditions. Also, fixed time signal.

**PROGRESSION:** A term used to describe the progressive movement of traffic through several signalized intersections.

**SCREEN-LINE:** An imaginary line or physical feature across which all trips are counted, normally to verify the validity of mathematical traffic models.

**SIGNAL CYCLE:** The time period in seconds required for one complete sequence of signal indications.

**SIGNAL PHASE:** The part of the signal cycle allocated to one or more traffic movements.

**STARTING DELAY:** The delay experienced in initiating the movement of queued traffic from a stop to an average running speed through a signalized intersection.

**TRAFFIC-ACTUATED SIGNAL:** A type of traffic signal that directs traffic to stop and go in accordance with the demands of traffic, as registered by the actuation of detectors.

**TRIP:** The movement of a person or vehicle from one location (origin) to another (destination). For example, from home to store to home is two trips, not one.

**TRIP-END:** One end of a trip at either the origin or destination; i.e. each trip has two trip-ends. A trip-end occurs when a person, object, or message is transferred to or from a vehicle.

**TRIP GENERATION RATE:** The quantity of trips produced and/or attracted by a specific land use stated in terms of units such as per dwelling, per acre, and per 1,000 square feet of floor space.

**TRUCK:** A vehicle having dual tires on one or more axles, or having more than two axles.

**UNBALANCED FLOW:** Heavier traffic flow in one direction than the other. On a daily basis, most facilities have balanced flow. During the peak hours, flow is seldom balanced in an urban area.

**VEHICLE MILES OF TRAVEL:** A measure of the amount of usage of a section of highway, obtained by multiplying the average daily traffic by length of facility in miles.

**APPENDIX B**

**Scoping Agreement**

# Scope of Study Form

**To be completed by applicant and approved by Development Services prior to start of study**

Project Name: Waterman Industrial Center  
 Project Address: Southwest corner of Waterman Avenue and Dumas Drive  
 Project Description: 564,652 square feet of high-cube warehouse distribution center land use  
 Developer's Name: NEWCASTLE PARTNERS, INC.  
 Address: 4740 Green River Road, Suite 118 Corona, CA 92880  
 Telephone No. 951-582-9800 x23 Fax Number: 951-278-4740  
 Email Address: jackson@newcastlepartners.com

Trip Generation Rates From: ITE 9th Ed. Other: City of Fontana, Truck Trip Generation Study, August 2003

**Trip Generation For:**

**APPENDIX F**

**Explanation and Calculation of Intersection Delay**

## **EXPLANATION AND CALCULATION OF INTERSECTION LEVEL OF SERVICE USING DELAY METHODOLOGY**

The levels of service at the unsignalized and signalized intersections are calculated using the delay methodology in the Highway Capacity Manual. This methodology views an intersection as consisting of several lane groups. A lane group is a set of lanes serving a movement. If there are two northbound left turn lanes, then the lane group serving the northbound left turn movement has two lanes. Similarly, there may be three lanes in the lane group serving the northbound through movement, one lane in the lane group serving the northbound right turn movement, and so forth. It is also possible for one lane to serve two lane groups. A shared lane might result in there being 1.5 lanes in the northbound left turn lane group and 2.5 lanes in the northbound through lane group.

For each lane group, there is a capacity. That capacity is calculated by multiplying the number of lanes in the lane group times a theoretical maximum lane capacity per lane time's 12 adjustment factors.

Each of the 12 adjustment factors has a value of approximately 1.00. A value less than 1.00 is generally assigned when a less than desirable condition occurs.

The 12 adjustment factors are as follows:

1. Peak hour factor (to account for peaking within the peak hour)
2. Lane utilization factor (to account for not all lanes loading equally)
3. Lane width
4. Percent of heavy trucks
5. Approach grade
6. Parking
7. Bus stops at intersections
8. Area type (CBD or other)
9. Right turns
10. Left turns

11. Pedestrian activity
12. Signal progression

The maximum theoretical lane capacity and the 12 adjustment factors for it are all unknowns for which approximate estimates have been recommended in the Highway Capacity Manual. For the most part, the recommended values are not based on statistical analysis but rather on educated estimates. However, it is possible to use the delay method and get reasonable results as will be discussed below.

Once the lane group volume is known and the lane group capacity is known, a volume to capacity ratio can be calculated for the lane group.

With a volume to capacity ratio calculated, average delay per vehicle in a lane group can be estimated. The average delay per vehicle in a lane group is calculated using a complex formula provided by the Highway Capacity Manual, which can be simplified and described as follows:

Delay per vehicle in a lane group is a function of the following:

1. Cycle length
2. Amount of red time faced by a lane group
3. Amount of yellow time for that lane group
4. The volume to capacity ratio of the lane group

The average delay per vehicle for each lane group is calculated, and eventually an overall average delay for all vehicles entering the intersection is calculated. This average delay per vehicle is then used to judge Level of Service. The Level of Services are defined in the table that follows this discussion.

Experience has shown that when a maximum lane capacity of 1,900 vehicles per hour is used (as recommended in the Highway Capacity Manual), little or no yellow time penalty is used, and none of the 12 penalty factors are applied, calculated delay is realistic. The delay calculation for instance assumes that yellow time is totally unused. Yet experience shows that most of the yellow time is used.

An idiosyncrasy of the delay methodology is that it is possible to add traffic to an intersection and reduce the average total delay per vehicle. If the average total delay is 30 seconds per vehicle for all vehicles traveling through an intersection, and traffic is added to a movement that has an average total delay of 15 seconds per vehicle, then the overall average total delay is reduced.

The delay calculation for a lane group is based on a concept that the delay is a function of the amount of unused capacity available. As the volume approaches capacity and there is no more unused capacity available, then the delay rapidly increases. Delay is not proportional to volume, but rather increases rapidly as the unused capacity approaches zero.

Because delay is not linearly related to volumes, the delay does not reflect how close an intersection is to overloading. If an intersection is operating at Level of Service C and has an average total delay of 18 seconds per vehicle, you know very little as to what percent the traffic can increase before Level of Service E is reached.

## LEVEL OF SERVICE DESCRIPTION<sup>1</sup>

| Level Of Service | Description  | Average Total Delay Per Vehicle (Seconds) |                |
|------------------|--|---|----------------|
|                  |  | Signalized                                | Unsignalized   |
| A                | Level of Service A occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.   | 0 to 10.00                                | 0 to 10.00     |
| B                | Level of Service B generally occurs with good progression and/or short cycle lengths. More vehicles stop than for Level of Service A, causing higher levels of average total delay.  | 10.01 to 20.00                            | 10.01 to 15.00 |
| C                | Level of Service C generally results when there is fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.  | 20.01 to 35.00                            | 15.01 to 25.00 |
| D                | Level of Service D generally results in noticeable congestion. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume to capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.   | 35.01 to 55.00                            | 25.01 to 35.00 |
| E                | Level of Service E is considered to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high volume to capacity ratios. Individual cycle failures are frequent occurrences.   | 55.01 to 80.00                            | 35.01 to 50.00 |
| F                | Level of Service F is considered to be unacceptable to most drivers. This condition often occurs with oversaturation, i.e., when arrival flow rates exceed the capacity of the intersection. It may also occur at high volume to capacity ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels. | 80.01 and up                              | 50.01 and up   |
