

# FINAL MITIGATED NEGATIVE DECLARATION

April 2016

**PROJECT NAME:** Waterman Industrial Center

**PROJECT NUMBERS:** Development Permit Type D – 15-11

**This Document is Considered Draft Until it is Adopted by the Appropriate City of San Bernardino Decision-Making Body.**

This Mitigated Negative Declaration is comprised of this form along with the Environmental Initial Study that includes the following:

- a. Initial Study Form
- b. Environmental Analysis Form and attached extended studies for Air Quality (as amended March 24, 2016) and Greenhouse Gas Emissions, Biological Resources, Cultural Resources (as amended February 16, 2016), Geotechnical Report, Noise, and Traffic and Transportation (as amended April 22, 2016).

1. California Environmental Quality Act Negative Declaration Findings:

Find, that this Mitigated Negative Declaration reflects the decision-making body's independent judgment and analysis, and; that the decision-making body has reviewed and considered the information contained in this Mitigated Negative Declaration and the comments received during the public review period; and that revisions in the project plans or proposals made by or agreed to by the project applicant would avoid the effects or mitigate the effects to a point where clearly no significant effects would occur; and, on the basis of the whole record before the decision-making body (including this Mitigated Negative Declaration) that there is no substantial evidence that the project as revised will have a significant effect on the environment.

2. Required Project Design Elements and Mitigation Measures:

The following project design elements and mitigation measures were either proposed in the project application or the result of compliance with specific environmental laws and regulations and were essential in reaching the conclusions within the attached Environmental Initial Study. Both the project design elements and the mitigation measures must be assured to avoid potentially significant environmental effects.

Refer to the attached Environmental Initial Study for the rationale for requiring the following mitigation measures:

## Biological Resources

- B-1a Trees and other suitable nesting habitat within the limits of work shall be surveyed by a qualified biologist prior to initiating construction-related activities. A pre-construction survey would be conducted no more than 72 hours prior to the start of work. If no nests are observed, construction activities should be initiated within 72 hours. If more than 72 hours pass and construction has not been initiated, another survey would be required.
- B-1b If, during the breeding season, an active nest is discovered in a tree or shrub to be removed, the tree or shrub shall be protected using orange construction fence or the equivalent. The protective fencing shall be placed around the tree or shrub at the following distance depending on species: 25 feet from the drip line of the tree or shrub for passerines and non-raptors; 300 feet from the drip line of the tree for raptors. No parking, storage of materials, or work would be allowed within this area until the end of the breeding season or until the young have fledged, as determined by a qualified biologist.
- B-2 Tree Removal Permit. Prior to the issuance of a grading permit, an arborist survey and report including a tree replacement program shall be prepared for review and approval by the City of San Bernardino Community Development Director. Subject to the approval of the report, the City shall issue a tree removal permit.

## Cultural Resources

- CR-1 Prior to beginning project construction, the Project applicant shall retain an archaeological monitor to monitor initial ground-disturbing activities in an effort to identify any unknown archaeological resources. Any newly discovered cultural resource deposits shall be subject to a cultural resources evaluation.

## Geology and Soils

- G-1 All grading and construction of the Project site shall comply with the geotechnical recommendations contained in the Geotechnical Engineering Investigation prepared by NorCal Engineering dated April 2015. All recommendations contained in the report shall be incorporated into all final and engineering and grading plans.

## Greenhouse Gas Emissions

- GHG-1 The project applicant shall provide sidewalks within the project boundary and along the off-site roadway improvements.
- GHG-2 The project applicant shall require that any future tenants institute a ride sharing program and employee vanpool/shuttle that is open to all employees.
- GHG-3 The project applicant shall require that all building structures meet or exceed 2013 Title 24 Standards and Green Building Code Standards.
- GHG-4 The project applicant shall require that all lighting installed in the proposed structures uses on average a minimum of 5 percent less energy than conventional metal halide warehouse lighting.
- GHG-5 The project applicant shall require that all faucets, toilets and showers installed in the proposed structures utilize low-flow fixtures that would reduce indoor water

demand by 20% per CalGreen Standards.

- GHG-6 The project applicant shall require that ENERGY STAR-compliant appliances are installed on site.
- GHG-7 The project applicant shall require all future tenants to institute recycling programs that reduces waste to landfills by a minimum of 50 percent (75 percent by 2020) and includes designated recycling bins at each proposed structure and requires all green waste to be processed at a recycling or composting facility.

## Noise

### Construction

- N-1 During all project site excavation and grading on site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.
- N-2 The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.
- N-3 Equipment shall be shut off and not left to idle when not in use.
- N-4 The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.
- N-5 The project applicant shall mandate that the construction contractor prohibit the use of music or sound amplification on the project site during construction.
- N-6 The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment.
- N-7 Limit the use of heavy equipment or vibratory rollers and soil compressors along the project boundaries to the greatest degree possible. It is acknowledged that some soil compression may be necessary along the project boundaries.
- N-8 Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.
- N-9 For the duration of construction activities, the construction manager shall serve as the contact person should noise levels become disruptive to local residents. A sign should be posted at the project site with the contact phone number.

### Operational

- N-10 The project shall construct an 8-foot noise barrier along the northern project boundary in accordance with the Kunzman Noise Study. The wall shall be positioned at the top of slope or pad, whichever is greater such that it provides optimum sound attenuation.

**Transportation/Traffic**

- TRAF-1 Install traffic signal at Waterman Avenue and Park Center Circle North. The traffic signals within the study area should include an interconnection of the traffic signals to function in a coordinated system.
- TRAF-2 As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

**ADOPTION STATEMENT:** This Mitigated Negative Declaration was adopted and above California Environmental Quality Act findings made by the City of San Bernardino Council on:

---

- A. Air Quality, Global Climate Change, and Health Risk Assessment Impact Analysis
- B. Biological Constraints Analysis
- C. Cultural Resource Study Findings Memo
- D. Geotechnical Engineering Investigation
- E. Noise Impact Analysis
- F. Traffic Impact Analysis and Traffic Impact Analysis Addendum

## I. Introduction

### *Project History*

The proposed project site is located in the southcentral portion of the City of San Bernardino (City) as depicted in Figure 1, Regional Location. The project site encompasses 12 parcels on approximately 26 acres and is bound by East Dumas Avenue to the north and South Waterman Avenue to the east. Orange Show Road is located approximately 0.2 mile north of the project site; see Figure 2, Vicinity Map.

Newcastle Partners (applicant) and the applicant's representative met with City staff on April 28, 2015 to review project specifics and obtain the City's initial input regarding site constraints and the entitlement process. In May 2015, a pre-application package with project site plans and associated information was submitted to the City. The applicant and applicant's representative attended a pre-application review meeting with the City's Development/Economic Review Committee on June 25, 2015.

### *Current Application*

The applicant proposes to develop a 564,652-square-foot (SF) industrial center building on the southwest corner of the intersection of East Dumas Street and South Waterman Avenue (see *Project Description* below).

In accordance with the California Environmental Quality Act (CEQA) (California Public Resources Code [PRC] Section 21000 et seq.) and its Guidelines (California Code of Regulations, Title 14, Section 15000 et seq.), this Initial Study (IS) has been prepared to evaluate the potential environmental effects associated with the construction and operation of the proposed Waterman Industrial Center project.

As set forth in the State CEQA Guidelines Section 15070, an Initial Study leading to a Mitigated Negative Declaration (IS/MND) can be prepared when the Initial Study has identified potentially significant environmental impacts, but revisions have been made to the project, prior to public review of the Initial Study, that would avoid or mitigate the impacts to a level considered less than significant; and there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment. This document, together with other technical analysis documents referenced herein, serve as the environmental review of the proposed Waterman Industrial Center.

This version of the document reflects changes to the Final IS/MND as a result of public comments on the Draft IS/MND. Revisions to the Draft IS/MND text are indicated by bold text (**bold**) for text additions and strike out (~~strike out~~) for deleted text. The comments and responses do not result in any new significant information and do not change the findings or conclusions presented in the Draft IS/MND.

Pursuant to Section 15367 of the State CEQA Guidelines, the City is the Lead Agency charged with the responsibility of deciding whether to approve the proposed project.

With respect to the requirements for an Initial Study, the applicable sections of the State CEQA Guidelines Section 15063 include:

(A.1) All phases of project planning, implementation, and operation must be considered in the Initial Study of the project.

(A.3) An initial study may rely upon expert opinion supported by facts, technical studies or other substantial evidence to document its findings. However, an Initial Study is neither intended nor required to include the level of detail included in an EIR.

(B.2) The Lead Agency shall prepare a Negative Declaration if there is no substantial evidence that the project or any of its aspects may cause a significant effect on the environment.

The purposes of an Initial Study are to:

(C.1) Provide the Lead Agency with information to use as the basis for deciding whether to prepare an EIR or a Negative Declaration.

(C.2) Enable an applicant or Lead Agency to modify a project, mitigating adverse impacts before an EIR is prepared, thereby enabling the project to qualify for a Negative Declaration.

(C.4) Facilitate environmental assessment early in the design of a project;

(C.5) Provide documentation of the factual basis for the finding in a Negative Declaration that a project will not have a significant effect on the environment;

(C.6) Eliminate unnecessary EIRs;

An Initial Study shall contain in brief form:

(D.1) A description of the project including the location of the project;

(D.2) An identification of the environmental setting;

(D.3) An identification of environmental effects by use of a checklist, matrix, or other method, provided that entries on a checklist or other form are briefly explained to indicate that there is some evidence to support the entries. The brief explanation may be either through a narrative or a reference to another information source such as an attached map, photographs, or an earlier EIR or negative declaration. A reference to another document should include, where appropriate, a citation to the page or pages where the information is found.

(D.4) A discussion of the ways to mitigate the significant effects identified, if any;

(D.5) An examination of whether the project would be consistent with existing zoning, plans, and other applicable land use controls;

(D.6) The name of the person or persons who prepared or participated in the Initial Study.

(E) If the project is to be carried out by a private person or private organization, the Lead Agency may require such person or organization to submit data and information which will enable the Lead Agency to prepare the Initial Study. Any person may submit any information in any form to assist a Lead Agency in preparing an Initial Study.

(G) As soon as a Lead Agency has determined that an Initial Study will be required for the project, the Lead Agency shall consult informally with all Responsible Agencies and all Trustee Agencies responsible for resources affected by the project to obtain the recommendations of those agencies as to whether an EIR or a Negative Declaration should be prepared. During or immediately after preparation of an Initial Study for a private project, the Lead Agency may consult with the applicant to determine if the applicant is willing to modify the project to reduce or avoid the significant effects identified in the Initial Study.

## II. Description of Proposed Project

The proposed Waterman Industrial Center (proposed project) is a 564,652-SF industrial building with office space, parking, a pump house, and landscaping on an approximately 26-acre property located on the southwest corner of the intersection of East Dumas Street and South Waterman Avenue in the City of San Bernardino.

The industrial building would be one floor with a maximum height of 47 feet. The building would be a cross dock warehouse facility with 10,000 SF of dedicated office/mezzanine space. The site will also include a 427-SF pump house. The building would have 49 dock doors on its northern frontage and 49 on its southern frontage. Total on-site parking would be 452 stalls, with 286 dedicated to warehouse parking (including office) and 166 trailer parking spaces. Landscaping in the amount of 103,585 SF is anticipated for the site and the southwest corner of the site would be used as a storm water/water quality control basin. Roadway frontage improvements would be provided on South Waterman Avenue and East Dumas Street.

There are two site access alternatives evaluated in this Initial Study for the proposed project. Alternative A proposes site access would be provided from one signalized full movement driveway and right-in/right-out driveway on South Waterman Avenue and two full movement driveways on East Dumas Street. Alternative B would eliminate the right-in/right-out driveway on South Waterman Avenue; all other access points to and from the proposed project would remain the same as Alternative A.

Additionally, there are 8 Southern California Edison (SCE) power poles that contain 6 wires of high voltage 66kv Edison transmission lines, a 3 wire 12kv system and a 3 wire 4kv system. Seven of the poles are made of wood, while the most easterly pole near the intersection of Dumas Street and Waterman Avenue is made of tubular steel. Due to the size of the electrical transmission lines, undergrounding these lines is not feasible. With implementation of the project, 5 of the 8 power poles would be relocated outside the ultimate roadway improvements on the south side of Dumas Street.

The industrial building is currently planned as a “spec building.” Thus, the future tenant of the building is not currently known. Furthermore, without knowing the future tenant, an exact number of future employees or hours of operation cannot be determined. Therefore, this Initial Study and associated technical reports use approximate potential on-site employees, hours of operation, and trip counts to and from the site based on the project’s proposed square footage and use as an industrial center building.

As further described below, the proposed project requires a General Plan Amendment (GPA) and Zoning Map Amendment (ZMA). Construction of the proposed project is expected to commence in June 2016 and be completed in March 2017. The project would be operational in 2017.

### ***Existing Project Site***

The project site is currently comprised of the following 12 parcels: 014-143-101, 014-143-102, 014-143-103, 014-143-104, 014-143-108, 014-143-109, 014-143-110, 014-143-111, 0104-143-112, 014-143-116, 014-143-120, and 014-143-121. Upon approval of the project, the 12 existing parcels would be consolidated into 1 parcel. Current uses on the 12 parcels include 5 vacant parcels, 4 parcels with single-family residential homes, 1 parcel with a church, and 1 parcel used as a golf course driving range. There is existing utility access (water, sewer, electricity, gas) to the project site.

Various species of trees are located on the site, primarily on the periphery of the parcel used as a golf course driving range. It is estimated that most or all of these trees would be required to be removed with construction of the proposed project. The golf course supports no native vegetation and generally consists of mowed non-native grass. There are no native habitats on site. The

remainder of the lots are largely absent of vegetation, with some interspersed trees. The site is not located in a defined area by the City for potential habitat for sensitive wildlife or in a biological resource area. The site is not located in an area of archaeological or historical sensitivity as identified by the City.

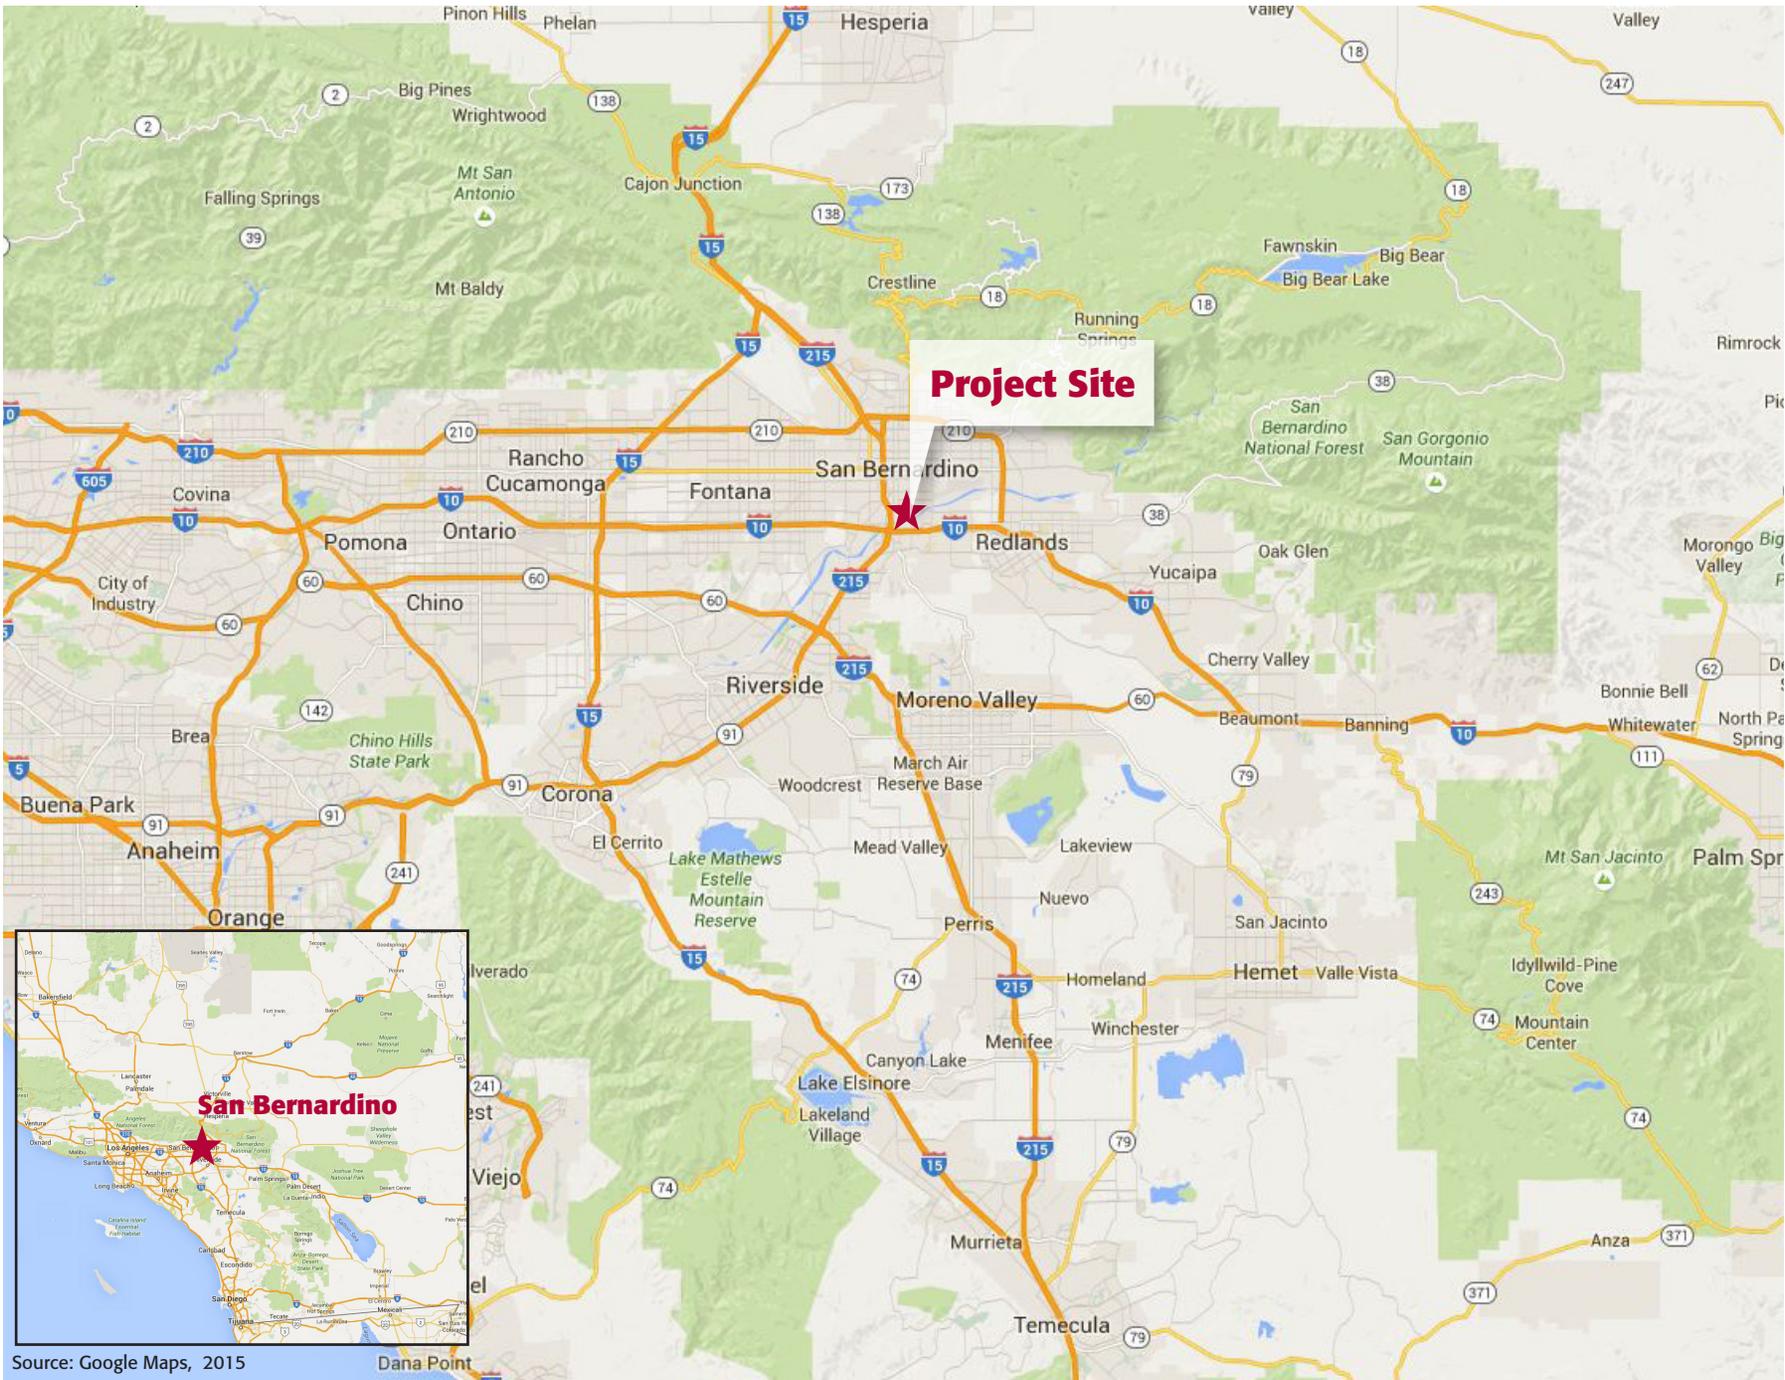

### ***Project Site Vicinity***

Single-family residences, vacant lots, and light industrial uses are located north of the site. Professional office uses, a vacant lot, and light industrial uses are located east of the site. A public golf course is located south of the site. The public golf course's parking lot, as well as vacant lots and single-family residences are located west of the site. Numerous cross dock facility warehouses, similar to the proposed industrial building for the project site, are located within the City approximately 0.5 mile northeast of the site.

### ***General Plan/Zoning & Project Approvals***

The City's General Plan land use designations for the site are Industrial and Open Space. The City's zoning designation for the site are approximately 7.5 acres of Industrial Light (IL), approximately 4 acres of Office Industrial Park (OIP), and approximately 14.4 acres of Public Commercial Recreation (PCR).

The proposed project is not consistent with the land use designations in the General Plan or the City's Zoning Map for the project site. Therefore, a General Plan Amendment (GPA) and Zoning Map Amendment (ZMA) will be required for the project's approval and implementation and are considered as a component of the proposed project. The GPA would re-designate the entire project site as Industrial and the ZMA would re-designate the entire site as Industrial Light (IL). Additional required project approvals include a Tentative Parcel Map and a Development Permit.

**FIGURE 3 - Site Plan**  
 Waterman Industrial Center Initial Study  
 City of San Bernardino

### **III. Waterman Industrial Center Project Environmental Impact Analysis and Project Approval**

The City of San Bernardino is the Lead Agency under CEQA and is responsible for reviewing and approving this Initial Study. As part of the proposed project's implementation, the City will also consider the following approvals:

- General Plan Amendment (GPA);
- Zoning Map Amendment (ZMA);
- Tentative Parcel Map (TPM); and
- Development Permit.

Additional permits may be required upon review of construction documents. Other permits required for the project may include, the issuance of encroachment permits for new driveways, sidewalks, and utilities, walls, fences, security and parking area lighting; building permits; and permits for new utility connections. These additional permits are considered ministerial in nature, and thus issuance of these permits would not trigger the need to further comply with CEQA. Development of the project will not require the issuance of any discretionary permits from any other federal, State, or local agency.

### ***Environmental Factors Potentially Affected***

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

- |   |  |   |
|---|--|---|
| <input type="checkbox"/> Aesthetics               | <input type="checkbox"/> Agricultural and Forestry Resources | <input type="checkbox"/> Air Quality                        |
| <input type="checkbox"/> Biological Resources     | <input type="checkbox"/> Cultural Resources                  | <input type="checkbox"/> Geology/Soils                      |

| <input type="checkbox"/> Transportation/Traffic   | <input type="checkbox"/> Utilities/Service Systems           | <input type="checkbox"/> Mandatory Findings of Significance |

### **IV. Determination**

On the basis of this evaluation:

- I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, (b) none of the conditions described in Guidelines Section 15162 for a Subsequent EIR or Section 15163 for a Supplemental EIR have occurred and (c) only minor technical changes or additions to the previous environmental documents are necessary.

## Environmental Evaluation

This section evaluates the potential environmental effects of the proposed project using the environmental checklist from the State CEQA Guidelines as amended. The definitions of the response column headings include:

- A. “Potentially Significant Impact” is appropriate if there is substantial evidence that an effect may be significant after the implementation of feasible mitigation measures.
- B. “Less than Significant With Mitigation Incorporated” applies where the incorporation of mitigation measure has reduced an effect from “Potentially Significant Impact” to a “Less Than Significant Impact.”
- C. “Less Than Significant Impact” applies where the project creates no significant impacts, only Less than Significant Impacts.
- D. “No Impact” applies where the project does not create an impact in that category.

### 1. Aesthetics

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|--|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:   |                                |  |                                     |                                     |
| a. Have a substantial adverse effect on a scenic vista?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| b. Substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a State-designated scenic highway? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| c. Substantially degrade the existing visual character or quality of the site and its surroundings?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |

### Discussion

a) *Have a substantial adverse effect on a scenic vista? **Less Than Significant Impact.***

The proposed project would not have a substantial adverse effect on a scenic vista. The dominant scenic views from the project site and the surrounding area include the San Gabriel Mountains and the San Bernardino Mountains located approximately six miles to the north. There are existing and planned industrial uses to the north and east of the project site. The proposed project is at a similar elevation as the surrounding area and would be consistent with planned development for the area. Numerous cross dock facility warehouses, similar to the proposed industrial building for the project site, are located within the City approximately 0.5 mile northeast of the site.

In addition, development of the site would convert residential homes, a church, a golf course driving range, and vacant land to light industrial development. However, this change would not substantially affect the aesthetic nature of the project area because much of the project area is vacant or developed land within no distinguishing visual resources.

Therefore, the change in views of the project site from the surrounding area would not cause a significant impact on a scenic vista. Impacts are less than significant.

- b) *Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway? **No Impact.***

The project site and the surrounding area is predominately developed or planned for development with no natural landforms or features remaining. The project site is located within an urban area with similar industrial uses as the proposed facility within the vicinity. In addition, there are no designated State or County designated scenic highways in the vicinity of the project site.<sup>1</sup> There are also no historically significant buildings on the site that could be affected by the proposed development as discussed under Cultural Resources. Thus, implementation of the proposed project would not block views of any scenic resources off site. For these reasons, no impact would occur in regards to adversely affecting scenic resources.

- c) *Substantially degrade the existing visual character or quality of the site and its surroundings? **Less than Significant Impact.***

The proposed project would be located in a predominately industrial and commercial area and would be consistent with the existing surrounding development. Implementation of the proposed project would alter the visual character of the project site; however, would not negatively impact or substantially degrade the visual quality of the site or its surroundings.

Short-term construction related aesthetic impacts would occur during the presence of construction equipment on the project site. No valuable aesthetic resources would be destroyed as a result of construction related-activities. These impacts are temporary in nature and would cease upon construction completion.

For these reasons, the proposed project would have a less than significant impact on the visual character of the site and its surroundings.

- d) *Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area? **Less Than Significant Impact.***

Existing outdoor lighting on the project site is associated with the developed parcels (single-family residences and a church) and the golf course driving range on the project site. Existing commercial and industrial uses in the vicinity of the project site also have outdoor lighting associated with buildings. The proposed project would include outdoor lighting on the site in the parking and entrance areas of the project site which would result in an increase in the existing level of illumination in the area.

The project's outdoor lighting would be compatible in brightness to the ambient lighting in the surrounding area and would utilize more stringent Backlight, Uplight, and Glare (BUG) rated fixtures whenever possible in order to minimize light pollution and trespass. Fixtures with a low BUG rating emit very little light where not needed, thus significantly reducing light pollution.

---

<sup>1</sup> California Department of Transportation. Official Designated Scenic Highways. Available at: [http://www.dot.ca.gov/hq/LandArch/scenic\\_highways/index.htm](http://www.dot.ca.gov/hq/LandArch/scenic_highways/index.htm). Accessed December 2, 2015.

Therefore, while the proposed project would increase outdoor lighting on the site and in the area, the increased outdoor lighting would be less than significant.

### **Cumulative Impacts**

The potential aesthetic impacts related to views, aesthetics, and light and glare are site specific. As discussed above, project-related impacts would be less than significant. While the proposed project plus cumulative development would change the appearance of the site and surrounding area, all development projects would be expected to be conditioned to follow applicable local planning and design guidelines. Therefore, aesthetic impacts are not expected to be cumulatively considerable and no adverse impacts would occur.

## 2. Agricultural and Forestry Resources

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact | No Impact                           |
|--|--------------------------------|--|------------------------------|-------------------------------------|
| <p>In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:</p> |                                |  |                              |                                     |
| <p>a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?</p>  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| <p>b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?</p>  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| <p>c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?</p>  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| <p>d. Result in the loss of forest land or conversion of forest land to non-forest use?</p>  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| <p>e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?</p>  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |

### Discussion

- a) *Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use? **No Impact.***

The project site and surrounding areas are not designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance on the State of California Important Farmland Map, and therefore would not result in a conversion of documented agricultural lands to non-agricultural use. Therefore, no impact would occur as a result of the proposed project.

- b) *Conflict with existing zoning for agricultural use, or a Williamson Act contract?* **No Impact.**

The project site is not currently zoned for agricultural use and is not under a Williamson Act contract. Therefore, no impact would occur as a result of the proposed project.

- c) *Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?* **No Impact.**

The project site is not currently zoned for forest land, timberland, or timberland zoned for production. Therefore, improvements planned as part of the proposed project would not conflict with existing zoning or cause rezoning of any such land. Therefore, no impact would result.

- d) *Result in the loss of forest land or conversion of forest land to non-forest use?* **No Impact.**

The project site does not contain forest land. Therefore, no impact would occur in regard to changing forest land to a non-forest use.

- e) *Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?* **No Impact.**

No designated agricultural or forest land is located within the project site. Thus, no impact would occur in this regard.

### **Cumulative Impacts**

The proposed project would have no impact on agricultural and forestry resources. Therefore, the proposed project would not contribute to a cumulatively considerable impact.

### 3. Air Quality

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:   |                                |  |                                     |                                     |
| a. Conflict with or obstruct implementation of the applicable air quality plan?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| c. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| d. Expose sensitive receptors to substantial pollutant concentrations?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| e. Create objectionable odors affecting a substantial number of people?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

#### Discussion

An Air Quality Technical Report was prepared by Kunzman Associates, Inc. (January 2016) to evaluate air quality impacts associated with the proposed project. The report is provided in Appendix A; the results and conclusions of the report are summarized herein.

a) *Conflict with or obstruct implementation of the applicable air quality plan? **Less Than Significant Impact.***

The project is consistent with the 2012 Air Quality Management Plan (AQMP). Therefore, the project would not conflict with or obstruct the implementation of the applicable air quality plan.

The project site is located within the western portion of San Bernardino County which is part of the South Coast Air Basin (Air Basin) that includes the non-desert portions of San Bernardino, Los Angeles, and Riverside Counties and all of Orange County. The Air Basin is located on a coastal plain with connecting broad valleys and low hills to the east. Regionally, the Air Basin is bound by the Pacific Ocean to the southwest and high mountains to the east forming the inland perimeter. The project site is located toward the northeast portion of the Air Basin near the foot of the San Bernardino Mountains which define the eastern boundary of the Air Basin. The South Coast Air Quality Management District (SCAQMD) and the California Air Resources Board (CARB) monitor air quality within the Air Basin.

The Air Basin has been designated by CARB as a nonattainment area for ozone (O3), and suspended particulates (PM10 and PM2.5). Currently, the South Coast Air Basin is in attainment with the ambient air quality standards for carbon monoxide (CO), lead, sulfur dioxide (SO2), nitrogen dioxide (NO2), and sulfates and is unclassified for visibility reducing particles and hydrogen sulfide.

The CARB, which is a part of the California Environmental Protection Agency (Cal EPA), is responsible for the coordination and administration of both federal and State air pollution control programs within California. In this capacity, the CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, provides oversight of local programs, and prepares the State Implementation Plan (SIP). The California SIP includes air quality district Air Quality Management Plans (AQMPs). The SIP must integrate federal, State, and local components and regulations to identify specific measures to reduce pollution, using a combination of performance standards and market-based programs within the timeframe identified in the SIP. As part of its enforcement responsibilities, the United States Environmental Protection Agency (U.S. EPA) requires each state with federal nonattainment areas to prepare and submit a SIP that demonstrates the means to attain the national standards.

AQMPs describe air pollution control strategies and measures to be implemented by a city, county, region, and/or air district. The primary purpose of an AQMP is to bring an area that does not attain federal and State air quality standards into compliance with the requirements of the federal Clean Air Act and California Clean Air Act. In addition, air quality plans are development to ensure that an area maintains a healthful level of air quality based on the National Ambient Air Quality Standards (NAAQS) and the CAAQS. The AQMP is prepared by SCAQMD and the Southern California Association of Governments (SCAG).

In 2007, the CARB approved the *South Coast Air Basin and the Coachella Valley 2007 Air Quality Management Plan for Attaining the Federal 8-hour Ozone and PM2.5 Standards*. The plan projected attainment for the 8-hour ozone standard by 2024 and the PM2.5 standard in 2015. On December 7, 2012, the SCAQMD's governing board approved the 2012 AQMP, which outlines its strategies for meeting the NAAQS for PM2.5 and ozone. The AQMP was forwarded to the CARB for inclusion in the California SIP in January 2013. The 1-hour ozone attainment demonstration and vehicle miles traveled emissions offset demonstration was submitted through CARB to the U.S. EPA. The 2012 AQMP demonstrates attainment with the 24-hour PM2.5 standard by 2014.

The SCAQMD's CEQA Handbook identifies two key indicators of consistency with the AQMP:

- 1) Whether the project will result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.
- 2) Whether the project will exceed the assumptions in the AQMP based on the year of project buildout and phase.

The Project would be consistent with the AQMP two key indicators as follows:

- 1) Criterion 1 - Increase in the Frequency or Severity of Violations

Based on the air quality modeling analysis contained in the Air Quality Technical Report, short-term construction impacts will not result in significant impacts based on the SCAQMD regional and local thresholds of significance. Additionally, long-

term operations impacts will not result in significant impacts based on the SCAQMD local, regional, and toxic air contaminant thresholds of significance. Therefore, the proposed project is not anticipated to contribute to the exceedance of any air pollutant concentration standards and is found to be consistent with the AQMP for the first criterion.

2) Criterion 2 - Exceed Assumptions in the AQMP?

Consistency with the AQMP assumptions is determined by performing an analysis of the proposed project with the assumptions in the AQMP. The emphasis of this criterion is to ensure that the analyses conducted for the proposed project are based on the same forecasts as the AQMP. The Regional Comprehensive Plan and Guide (RCP&G) consists of three sections: Core Chapters, Ancillary Chapters, and Bridge Chapters. The Growth Management, Regional Mobility, Air Quality, Water Quality, and Hazardous Waste Management chapters constitute the Core Chapters of the document. These chapters currently respond directly to federal and State requirements placed on SCAG. Local governments are required to use these as the basis of their plans for purposes of consistency with applicable regional plans under CEQA. For this project, the City of San Bernardino General Plan defines the assumptions that are represented in the AQMP.

The City's General Plan land use designations for the project site are Industrial and Open Space. The City's zoning designation for the site includes: Industrial Light, Office Industrial Park, and Public Commercial Recreation. Therefore, the proposed project is not currently consistent with the land use or zoning designations. However, buildout of the project site was anticipated in the City's General Plan and General Plan EIR, and thus, the Project is consistent with the assumptions of the AQMP. Approval of the proposed project includes a General Plan Amendment (GPA) and a Zoning Map Amendment (ZMA) to change the General Plan land use designation to Industrial and the zoning designation to Industrial Light. With approval of the GPA and ZMA, the proposed project would be consistent with the land use and zoning designations and development standards for the project site.

With approval of the GPA and ZMA, the proposed project would be consistent with the land use and zoning designations and development standards for the project site. Therefore, once the proposed project is approved, the project would not result in an inconsistency with the land use designation. Therefore, the proposed would not be anticipated to exceed the AQMP assumptions for the project site and would be consistent with the AQMP for the second criterion.

Based on the above, the proposed project would not conflict with implementation of the AQMP, impacts are considered to be less than significant.

- b) *Violate any air quality standard or contribute substantially to an existing or projected air quality violation? **Less Than Significant Impact.***

Construction Phase

Emissions from the construction phase of the proposed project were estimated based on information from the project developer for construction equipment requirements and schedule. It was assumed that construction of the proposed project would commence in June 2016 and be completed in March 2017. The project would be operational in 2017.

Construction emissions were evaluated using the CalEEMod Model Version 2013.2.2, which is a statewide land use emissions computer model published by the SCAQMD for estimating air pollutant emissions.

Table 1 provides a summary of the emission estimates for construction for the proposed project, assuming standard fugitive dust control measures would be implemented. As shown in Table 1, emissions of all criteria pollutants would be below the regional emissions thresholds. Therefore, a less than significant regional air quality impact would occur from construction of the proposed project.

**Table 1: Construction-Related Regional Pollutant Emissions<sup>1</sup>**

| Activity   | Pollutant Emissions (pounds/day) |              |              |                 |              |             |
|--|----------------------------------|--------------|--------------|-----------------|--------------|-------------|
|  | VOC                              | NOx          | CO           | SO <sub>2</sub> | PM10         | PM2.5       |
| <b>Demolition</b>  |                                  |              |              |                 |              |             |
| On-Site <sup>2</sup>   | 4.29                             | 45.66        | 35.03        | 0.04            | 2.50         | 2.17        |
| Off-Site <sup>3</sup>  | 0.11                             | 0.79         | 1.52         | 0.00            | 0.22         | 0.07        |
| <b>Subtotal</b>  | <b>4.39</b>                      | <b>46.45</b> | <b>36.55</b> | <b>0.04</b>     | <b>2.72</b>  | <b>2.24</b> |
| <b>Grading</b>   |                                  |              |              |                 |              |             |
| On-Site <sup>2</sup>   | 6.48                             | 74.81        | 49.14        | 0.06            | 6.16         | 4.61        |

Construction-related air emissions may have the potential to exceed the State and federal air quality standards in the project vicinity even though these pollutant emissions may not be significant enough to create a regional impact to the Air Basin. The proposed project has been analyzed for the potential local air quality impacts created from construction-related fugitive dust and diesel emissions; and from toxic air contaminants.

As shown in Table 2, the maximum number of acres disturbed in a day would be five acres during grading activities.

**Table 2: Maximum Number of Acres Disturbed Per Day<sup>1</sup>**

The local air quality emissions from construction were analyzed using the SCAQMD's Mass Rate Localized Significant Threshold Look-up Tables and the methodology described in Localized Significance Threshold (LST) Methodology, prepared by SCAQMD, revised July 2008. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily emissions of CO, NOx, PM10, and PM2.5 from a project could result in a significant impact to the local air quality. The nearest sensitive receptors to the project site are the single-family detached residential dwelling units on the north side of Dumas Street (approximately 65 feet from the project's northern property line), the single-family detached residential dwelling unit to the west of the project site (approximately 170 feet from the western property line). The San Bernardino Public Golf Course is located adjacent to the southern and southwestern property line.

The emission thresholds were calculated based on the Central San Bernardino Valley source receptor area (SRA 34), which covers an area from approximately west of Fontana to east of Highland, and a disturbance area of 5 acres per day at a distance of 25 meters (82 feet). Per SCAQMD LST Methodology, when the distance to the nearest sensitive receptors is less than 25 meters from the project boundary, the LST for 25 meters should be used. Table 3 identifies the on-site emissions for the different construction phases and shows that none of the analyzed criteria pollutants would exceed local emissions thresholds at the nearest sensitive receptors. Therefore, a less than significant local air quality impact would occur from construction of the proposed project.

**Table 3: Local Construction Emissions at the Nearest Receptor**

| Phase   | On-Site Pollutant Emissions<br>(pounds/day) |              |           |          |
|---|---|--------------|-----------|----------|
|   | NOx   | CO           | PM10      | PM2.5    |

Source: Kunzman Associates, January 15, 2016.

The greatest potential for toxic air contaminant emissions would be diesel particulate emissions associated with heavy equipment operations during construction. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of “individual cancer risk”. “Individual Cancer Risk” is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. Given the relatively limited number of heavy duty construction equipment and the short-term construction schedule, the proposed project would not result in a long-term (i.e., 70 years) substantial source of toxic air contaminant emissions and corresponding individual cancer risk. Therefore, no significant short-term toxic air contaminant impacts would occur during construction of the proposed project.

Operational Phase

The ongoing operation of the proposed project would result in a long-term increase in air quality emissions. This increase would be due to emissions from the project-generated vehicle trips and through operational emissions from ongoing uses. Operations-related air quality impacts were analyzed using CalEEMod. Mobile sources include emissions from vehicles; vehicle trips were based on the Waterman Industrial Center Traffic Impact Analysis (TIA) (Kunzman, 2015). Due to the proposed project’s location and proposed unrefrigerated warehouse land uses, the average customer based trip length was increased to 40 miles, while all other trip lengths were based on the urban default values.

Area sources include emissions from consumer products, landscape equipment, and architectural coatings. Energy usage includes emissions from the generation of electricity and natural gas used on site. It should be noted that 2013 Title 24 commercial standards are 30 percent more efficient than 2008 Title 24 Standards (used as the baseline for emissions calculations in CalEEMod). However, no reduction credit was taken.

Table 4 identifies the proposed project’s long-term operations. None of the criteria pollutants would exceed the regional emissions thresholds. Therefore, a less than significant regional air quality impact would occur from operation of the proposed project.

**Table 4: Regional Operational Pollutant Emissions Without Mitigation**

| Activity   | Pollutant Emissions (pounds/day) |              |              |             |             |             |

| Exceeds Threshold?   | No                               | No           | No           | No          | No          | No          |
| Source: Kunzman Associates, January 15, 2016.<br>1 Source: CalEEMod Version 2013.2.2<br>2 Area sources consist of emissions from consumer products, architectural coatings, and landscaping equipment.<br>3 Energy usage consists of emissions from generation of electricity and on-site natural gas usage.<br>4 Mobile sources consist of emissions from vehicles and road dust. |                                  |              |              |             |             |             |

Project-related air emissions may have the potential to have local CO emission impacts from the project vehicular trips and from on-site operations. To determine if the proposed project could cause emission levels in excess of the CO standards, a sensitivity analysis is typically conducted to determine the potential for CO “hot spots” at a number of intersections in the general project vicinity. Because of reduced speeds and vehicle queuing, “hot spots” typically occur at high traffic volume intersections with a Level of Service E or worse. The TIA showed that the project would generate 1,282 Passenger Car Equivalent (PCE) daily trips. The 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan) showed that an intersection which has a daily traffic volume of approximately 100,000 vehicles per day would not violate the CO standard. Therefore, as the intersection with the highest traffic volume falls far short of 100,000 vehicles, no CO “hot spot” modeling was performed and no significant long-term local air quality impact would occur with the ongoing use of the proposed project.

Project-related air emissions from on-site sources such as architectural coatings, landscaping equipment, and natural gas appliances have the potential to exceed the State and federal air quality standards. The nearest sensitive receptors are the residential dwelling units to the north and west of the boundaries of the project site. The local air quality emissions from on-site operations were analyzed according to the SCAQMD’s Localized Significance Threshold Methodology. Table 5 shows the on-site emissions from the CalEEMod model that includes natural gas usage, landscape maintenance equipment, and vehicles operating on site. The data provided in table shows that the ongoing operations would create a less than significant operations-related impact to local air quality due to on-site emissions and no mitigation would be required.

**Table 5: Local Operational Emissions at the Nearest Receptor<sup>1</sup>**

| On-Site Emission Source  | On-Site Pollutant Emissions (pounds/day) |              |             |             |

- c) *Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)? **Less Than Significant Impact.***

Cumulative projects include local development as well as general growth within the project area. As with most development, the greatest source of emissions is from mobile sources which disperse over a large area. The project area is in nonattainment for ozone and PM10 particulate matter. Construction and operation of cumulative projects will further degrade the local air quality, as well as the air quality of the Air Basin. The greatest cumulative impact on the quality of regional air quality will be the incremental addition of pollutants from increased traffic from residential, commercial, and industrial development and the use of heavy equipment and trucks associated with the construction of these projects. Air quality will be temporarily degraded during construction activities that occur separately or simultaneously. However, in accordance with the SCAQMD methodology, projects that do not exceed the SCAQMD criteria or can be mitigated to less than criteria levels are not significant and do not add to the overall cumulative impact. Cumulative short-term construction-related emissions and long-term operational emissions from the project will not contribute considerably to any potential cumulative air quality impacts because the project's emissions will not exceed SCAQMD daily thresholds.

- d) *Expose sensitive receptors to substantial pollutant concentrations? **Less Than Significant Impact.***

The CEQA Guidelines indicate that a potentially significant impact could occur if the proposed project would expose sensitive receptors to substantial pollutant concentrations. As discussed in question 3 b) above, and shown in Tables 3 and 5, the project's emissions will not exceed SCAQMD Localized Significance Thresholds at the closest receptor locations during construction or operation and impacts are less than significant.

Ongoing project operations would generate toxic air contaminant emissions from diesel truck emissions. According to SCAQMD methodology, health effects from carcinogenic air

toxics are usually described in terms of individual cancer risk. “Individual Cancer Risk” is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. The diesel particulate matter (DPM) emission factors for the various vehicle types were derived from the CARB EMFAC2011 mobile source emission model. The 70-year average factors were derived for San Bernardino County for 2017, the project buildout year. Emissions factors were estimated to establish the emissions generated while the vehicles travel off site, along travel links from the entrance to the loading docks, and while idling at the loading dock during loading or unloading materials. Health risks from diesel particulate matter are twofold. First, diesel particulate matter is a carcinogen according to the State of California. Second, long-term chronic exposure to diesel particulate matter can cause health effects to the respiratory system.

There are no schools in the project vicinity. The nearest sensitive receptors that may be impacted by the proposed project are the residential dwelling units to the north and west of the boundaries of the project site. The project-specific health risk assessment (HRA) performed by Kunzman Associates, as part of the air quality analyses, examined the potential for cancer- and non-cancer-related health risks associated with project operations to nearby sensitive receptors (located near the site's northern boundary [approximately 65 feet from the site] and to the west of the project (approximately 170 feet from the project's western boundary). Impacts to commercial receptors located just north of the site and at the San Bernardino Public Golf Course to the south of the project site (adjacent to the project's southern boundary) respectively, were also examined. The highest residential cancer risks at any receptor location does not exceed a cancer risk increase of 3.39 per million people. The highest risk to off-site workers does not exceed a cancer risk increase of 0.33 per million people. All off-site diesel emissions concentrations would be below the 10.0 in a million cancer risk threshold. Therefore, no significant long-term health impacts would occur to adjacent receptors from the operation of diesel trucks on the project site.

With respect to non-carcinogenic hazards to residential and worker receptors, the criterion for significance is a Hazard Index increase of 1.0 or greater. Using the maximum DPM concentration, the resulting Hazard Index is 0.0029. Therefore, the ongoing operations of the proposed project would result in a less than significant impact due to the non-cancer risk from diesel emissions created by the project.

e) *Create objectionable odors affecting a substantial number of people? **No Impact.***

Potential sources from the proposed project that may emit odors during construction activities include the application of materials such as asphalt pavement. The objectionable odors that may be produced during the construction process are short term and are expected cease upon the drying or hardening of the odor producing materials. Due to the short-term nature and limited amounts of odor producing materials being utilized, no significant impact related to odors would occur during construction of the proposed project.

Potential odor sources from ongoing operations would include odor emissions from diesel truck emissions and trash storage areas. Due to the distance of the nearest receptors from the project site and through compliance with SCAQMD's Rule 402, no significant impact related to odors would occur during the ongoing operations of the proposed project.

## **Cumulative Impacts**

A project that has a significant impact on air quality with regard to emissions of PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>x</sub> and/or ROG<sub>s</sub> as determined above would have a significant cumulative effect. In the event direct impacts from a project are less than significant, a project may still have a cumulatively considerable impact on air quality if the emissions from the project, in combination with the emissions from other proposed, or reasonably foreseeable future projects are in excess of screening levels identified above, and the project's contribution accounts for more than an insignificant proportion of the cumulative total emissions. With regard to past and present projects, the background ambient air quality, as measured at the monitoring stations maintained and operated by the SCAQMD, measures the concentrations of pollutants from existing sources. Past and present project impacts are therefore included in the background ambient air quality data. As discussed above, the proposed project emissions would be below the significance thresholds during both construction and operations. The impact would therefore not be cumulatively considerable.

#### 4. Biological Resources

| b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?   | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>     | <input type="checkbox"/>            |
| e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?  | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>     | <input type="checkbox"/>            |
| f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |

#### Discussion

- a) *Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or the USFWS? No Impact.*

A Biological Constraints Analysis was prepared by Rocks Biological Consulting Inc. (RBC) in December 2015. The Biological Constraints Report evaluated the suitability of the proposed project site to support sensitive biological resources. The results of this study provide current information on biological resources present on the proposed project site. The results of the biological constraints analysis performed by RBC is summarized herein and included as Appendix B to this Addendum.

The project site supports the following vegetation types or land uses:

- Developed – areas support no native vegetation and typically include human-made structures such as buildings or roads. Within the study area, developed areas occur primarily at the north end of the site and consist of single-family homes, a church, and roads. Included in the developed land use is a public golf course that supports no native vegetation and generally consists of mowed non-native grass. The golf course is located at the south end of the study site.
- Disturbed – areas typically include land that has been previously disturbed by vegetation clearing, development, or agricultural activities. Areas mapped as disturbed include lands generally cleared of vegetation such that little or no natural habitat remains and lands disturbed such that, where vegetated, at least 50 percent of plant cover is non-native species. The disturbed lands on the site are dominated by puncture vine (*Tribulus terrestris*), London rocket (*Sisymbrium irio*), and Russian thistle (*Salsola australis*). Other plants that occur include castor bean (*Ricinus communis*), ripgut brome (*Bromus diandrus*), short-pod mustard (*Hirschfeldia incana*), alkali mallow (*Malvella leprosa*), and filaree species (*Erodium spp.*).
- Ornamental – areas typically consist of non-native landscape and/or garden plantings that have been planted in association with development. San Bernardino County supports many ornamental trees, shrubs, and herbs that decorate urban areas. Ornamental species occur on the site in association with adjacent residential development, notably rows of planted and irrigated pine trees (*Pinus sp.*) and a patch of Chinese elm (*Ulmus parvifolia*).

Table 6 summarizes the vegetation types and land uses on the site.

**Table 6: Vegetation Communities/Land Uses**

| Vegetation/Land Use           | Acres in Project boundary | Acres in study area |
|-------------------------------|---------------------------|---------------------|
| Developed (incl. golf course) | 22.42                     | 26.71               |
| Disturbed Land                | 2.81                      | 8.95                |
| Ornamental                    | 0.16                      | 0.33                |
| Total                         | 25.39                     | 35.99               |

No threatened, endangered, or sensitive animal or plant species were observed on-site during the general biological survey. CNDDDB records were used to help determine if sensitive species occur within the vicinity of the project site. As identified in Table 7, based on the developed and disturbed condition of the site and lack of native habitats, the site does not have potential to support sensitive species.

**Table 7: CNDDDB Species Recorded within Vicinity of the Site**

| Species   | Potential to Occur/Comments  |
|---|--|
| marsh sandwort ( <i>Aemaria paludicola</i> )                                  | None. Species occurs in marsh habitats, which are not present on site.   |
| bristly sedge ( <i>Carex comosa</i> )   | None. Species occurs in wetland and riparian habitats, which are not present in the parcel. Species is most often associated with lake margins and edges, which are not present on site.   |
| Busck's gallmoth ( <i>Carolella busckana</i> )                                | None. Species occurs in coastal scrub dunes that are not present on site.  |
| smooth tarplant ( <i>Centromadia pungens</i> ssp. <i>laevis</i> )             | None. Species occurs in habitats such as chenopod scrub, meadows and seeps, playas, riparian woodlands, and valley and foothill grasslands. No suitable habitat types are present on site. |
| salt marsh bird's beak ( <i>Chloropyron maritimum</i> ssp. <i>maritimum</i> ) | None. Species occurs on salt marshes and salt flats, which are not present on site.  |
| Parry's spineflower ( <i>Chorizanthe parryi</i> var. <i>parryi</i> )          | None. Species occurs on chaparral and coastal sage scrub habitats, which are not present on site.  |
| western yellow-billed cuckoo ( <i>Coccyzus americanus occidentalis</i> )      | None. Species occurs in riparian habitats, which are not present on site.  |
| Peruvian dodder ( <i>Cuscuta obtusiflora</i> var. <i>glandulosa</i> )         | None. Species occurs in freshwater marshes and swamps that are not present on site.  |
| San Bernardino kangaroo rat ( <i>Dipodomys merriami parvus</i> )              | None. Species occurs in alluvial fan sage scrub habitats, which are not present in the parcel. These habitat types are confined to rivers and floodplains, which are not present on site.  |
| slender-horned spineflower ( <i>Dodecahema leptoceras</i> )                   | None. Species occurs in alluvial scrub habitats, which are not present on site.  |
| Los Angeles sunflower ( <i>Helianthus nuttallii</i> ssp. <i>parishii</i> )    | None. Species occurs in freshwater or salt marsh habitats, which are not present on site.  |
| Gambel's water cress ( <i>Nasturtium gambelii</i> )                           | None. Species is aquatic or semi-aquatic. It is found in lakesides and marshes, which are not present on site.   |
| pocketed free-tailed bat ( <i>Nyctinomops femorosaccus</i> )                  | None. Species is associated with cliffs and rocky outcrops, which are not present on site.   |
| Delhi Sands flower-loving fly ( <i>Rhaphiomidas terminates abdominalis</i> )  | None. Species occurs in Delhi sand habitats, which are not present on site.  |
| Parish's gooseberry ( <i>Ribes divaricatum</i> var. <i>parishii</i> )         | None. Species occurs in wetland habitats and occasionally in coastal sage scrub habitats, which are not present on site.   |
| prairie wedge-grass ( <i>Sphenopholis obtusata</i> )                          | None. Species occurs in mesic prairies, thinly wooded bluffs, open rocky woodlands, and pasture habitats, which are not present on site.   |
| least Bell's vireo ( <i>Vireo bellii pusillus</i> )                           | None. Species occurs in riparian and willow scrub habitats, which are not present on site.   |

Source: Rocks Biological Consulting, December 2015.

As described above, the proposed project would not have an effect, either directly or through habitat modifications, on any species identified as a candidate as sensitive, or as a special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or United States Fish and Wildlife Service (USFWS). The project site is graded and does not contain suitable habitat for any protected species. Therefore, there would be no impact to sensitive species.

- b) *Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game (DFG) or U.S. Fish and Wildlife Service? **No Impact.***

The project site is relatively flat and has previously been disturbed by human activities. There are no native habitats on site. Additionally, no drainages, riparian habitat, or aquatic features were observed during the site visit. The project proposes to consolidate the 12 existing parcels into 1 parcel and demolish all internal structures in order to facilitate the development of the distribution center. No impacts to riparian habitat or other sensitive natural community would occur as a result of the proposed project.

- c) *Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means? **No Impact.***

As discussed above in threshold 4.b, there were no potentially jurisdictional features, including federally protected wetlands and other features that carry water identified on the project site. Therefore, no impacts would occur.

- d) *Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites? **Less Than Significant Impact with Mitigation Incorporated.***

*Wildlife Corridors:* The project site is not located within a known migratory wildlife corridor or wildlife nursery site. Construction of the proposed project would not impact a wildlife corridor. Therefore, there would be no impact to migratory wildlife or corridors.

*Nesting Birds:* Nesting birds and their nests are protected under the provisions of the Migratory Bird Treaty Act (MBTA) and California Department of Fish and Wildlife (CDFW) codes. Suitable habitat for birds protected by the MBTA occurs on the project site. The intentional loss of any active bird nests during project construction would be considered a significant impact. Implementation of Mitigation Measures B-1a and B-1b would reduce potential impacts to nesting birds to a less than significant level.

### **Mitigation Measures**

B-1a ~~If removal of trees and shrubs is to be done during the nesting season (February 1 to September 15), all trees and other suitable nesting habitat within the limits of work shall be surveyed by a qualified biologist prior to initiating construction-related activities. A pre-construction survey would be conducted no more than **72 hours 14 days** prior to the start of work. If no nests are observed, construction activities should be initiated within **72 hours 14 days**. If more than **72 hours 14 days** pass and construction has not been initiated, another survey would be required.~~

B-1b If, during the breeding season, an active nest is discovered in a tree or shrub to be removed, the tree or shrub shall be protected using orange construction fence or the equivalent. The protective fencing shall be placed around the tree or shrub at the following distance depending on species: 25 feet from the drip line of the tree or shrub for passerines and non-raptors; 300 feet from the drip line of the tree for raptors. No parking, storage of materials, or work would be allowed within this area until the end of the breeding season or until the young have fledged, as determined by a qualified biologist.

- e) *Conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy/ordinance? **Less Than Significant Impact with Mitigation Incorporated.***

The City of San Bernardino Municipal Code Section 19.28.100 requires a tree removal permit from the City where more than 5 trees will be cut down, uprooted, destroyed, or removed within a 36-month period. Section 19.28.100 mandates the replacement of removed trees on a 1:1 basis. An arborist survey and report may be required to evaluate existing trees prior to the issuance of a tree removal permit. The preparation of the arborist's survey and report, and the replacement of trees as set forth in the permit would mitigate impacts to a less than significant level.

#### **Mitigation Measures**

B-2 Tree Removal Permit. Prior to the issuance of a grading permit, an arborist survey and report including a tree replacement program shall be prepared for review and approval by the City of San Bernardino Community Development Director. Subject to the approval of the report, the City shall issue a tree removal permit.

- f) *Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan? **No Impact.***

The project site is located in an urban environment and is not included in an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan. No impact relative to adopted habitat conservation or other approved local, regional or State plans would occur.

#### **Cumulative Impacts**

The proposed project would not cause a significant impact to biological resources. Therefore, the proposed project would not contribute to a cumulatively considerable impact.

## 5. Cultural Resources

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact | No Impact                           |
|--|--------------------------------|--|------------------------------|-------------------------------------|
| Would the project:   |                                |  |                              |                                     |
| a. Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?    | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>     | <input type="checkbox"/>            |
| b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5? | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>     | <input type="checkbox"/>            |
| c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?        | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| d. Disturb any human remains, including those interred outside of formal cemeteries?                           | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |

### Discussion

- a) *Cause a substantial adverse change in the significance of a historical resource? **Less Than Significant Impact with Mitigation Incorporated.***

A Cultural Resource Study Findings Memo was prepared by ASM Affiliates in November 2015 for the proposed project. The study included a records search at the South Central Coastal Information Center (SCCIC), a search of the Sacred Lands Files of the California Native American Heritage Commission (NAHC), and a pedestrian survey of accessible portions of the Project area. The memo is included as Appendix C and the findings are summarized below.

One previously unrecorded cultural resource, Waterman-1, a historic artifact scatter, was documented on the project site; no evidence was found regarding the presence of or potential for any prehistoric resources. Waterman-1 consists of a scatter of highly fragmented historic artifacts, likely dating to the earliest occupation of the parcel. Artifacts found include dozens of glass fragments ceramic and porcelain fragments; etc. Modern refuse was mixed with the historic materials to the same depths, further evidencing the significant disturbance that the parcel has undergone over the decades.

The only item with a bracketable date range was the amethyst glass. Amethyst glass dates circa 1880-1920, which corresponds to the single structure depicted in the early maps and photos. It does not appear that this early structure is the same house that is currently on the site at 285 East Dumas Street; these structures appear in somewhat different locations. At least some of the deposit was likely related to the now removed earliest structure while some of the fragments in the scatter appear to be circa 1950s-1960s. As such, this is a mixed deposit likely from various episodes of refuse disposal into what may have long served as a sort of communal backyard area for the houses lining the edges of this parcel.

No evidence of intact subsurface deposits was identified at Waterman-1. Because the site contains only highly fragmentary and disturbed remains, unassociated with intact archaeological deposits or features, Waterman-1 is recommended not eligible for listing in the California Register of Historic Resources.

The project site is located within a highly disturbed urbanized area and does not contain significant historic or archaeological resources. However, there is a possibility of currently undetectable historic subsurface deposits being present within the project site due to the area's early residential development. Implementation of Mitigation Measure CR-1 would reduce potential impacts to a less than significant level.

#### **Mitigation Measure**

CR-1 Prior to beginning project construction, the Project applicant shall retain an archaeological monitor to monitor initial ground-disturbing activities in an effort to identify any unknown archaeological resources. Any newly discovered cultural resource deposits shall be subject to a cultural resources evaluation.

- b) *Cause a substantial adverse change in the significance of an archaeological resource? Less Than Significant Impact with Mitigation Incorporated.*

As discussed above, implementation of Mitigation Measure CR-1 would reduce potential impacts to archaeological resources from the proposed project to a less than significant level.

- c) *Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature? No Impact.*

The project site is not located within an area defined by the City for paleontological sensitivity and there are no known paleontological resources located on the project site. The City's General Plan contains goals and policies that specifically address sensitive paleontological resources and their protection if they are encountered during any development activity. In the event that unknown paleontological resources are unearthed during construction activities on the project site, standard City conditions requiring the stoppage of work and identification of potential resources would apply. Therefore, the proposed project would not cause a substantial adverse change in the significance of a paleontological resource.

- d) *Disturb any human remains, including those interred outside of formal cemeteries? No Impact.*

No known human remains are located within the area of the project site. In the event that unknown human remains are unearthed during construction activities on the project site, standard City conditions requiring the stoppage of work and identification of human remains would apply. Therefore, the proposed project would not disturb human remains.

#### **Cumulative Impacts**

The proposed project would result in no impacts to historical, known archaeological or paleontological resources, or known human remains. The chances of cumulative impacts occurring as a result of project implementation plus implementation of other projects in the region is not likely since all proposed projects would be subject to individual project level environmental review. Since there would be no project-related impacts and due to existing laws and regulations in place to protect cultural resources and prevent significant impact to paleontological resources, the potential incremental effects of the proposed project would not be cumulatively considerable.

## 6. Geology and Soils

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|--|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:   |                                |  |                                     |                                     |
| a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:   |                                |  |                                     |                                     |
| i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42. |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| ii. Strong seismic ground shaking?   |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| iii. Seismic-related ground failure, including liquefaction?   |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| iv. Landslides?  |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| b. Result in substantial soil erosion or the loss of topsoil?  |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?   |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>            | <input type="checkbox"/>            |
| d. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?   |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?   |                                |  |                                     |                                     |
|  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

### Discussion

a) *Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:*

- 1) *Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42. **Less Than Significant Impact.***

A Geotechnical Engineering Investigation was prepared for the project site in April 2015 by NorCal Engineering. The report is provided in Appendix D and is summarized in this Initial Study section. The Alquist-Priolo Earthquake Fault Zoning Act (Act) was passed in

1972 to mitigate the hazard of surface faulting to structures for human occupancy. The Act's main purpose is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. The Act requires the State Geologist to establish regulatory zones, known as "Alquist-Priolo (AP) Earthquake Fault Zones," around the surface traces of active faults and to issue appropriate maps. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back from the fault (typically 50 feet). According to the Geotechnical Engineering Investigation, the project site is not located within an AP Earthquake Fault Zone. According to the report, there are no known active or potentially active faults trending towards or through the site and the potential for damage due to direct fault rupture is considered very remote. The possibility of significant fault rupture on the project site is considered to be less than significant.

2) *Strong seismic ground shaking? **Less Than Significant Impact.***

The site is located in an area of high regional seismicity and the San Jacinto (San Bernardino) fault is located less than 1.24 miles from the site. Ground shaking originating from earthquakes along other active faults in the region is expected to induce lower horizontal accelerations due to smaller anticipated earthquakes and/or greater distances to other faults. The proposed project would be required to be in conformance with the 2013 California Building Code (CBC), City regulations, and other applicable standards. Conformance with standard engineering practices and design criteria would reduce the effects of seismic groundshaking to a less than significant level.

3) *Seismic-related ground failure, including liquefaction? **Less than Significant Impact.***

Liquefaction generally occurs as a "quicksand" type of ground failure caused by strong groundshaking. The primary factors influencing liquefaction potential include groundwater, soil type, relative density of the sandy soils, confining pressure, and the intensity and duration of groundshaking. According to the Geotechnical Engineering Investigation, the project site is situated in an area of high generalized liquefaction susceptibility. Groundwater records from the Chino Basin Water Master (Fall 2006) found groundwater to be about 50 feet in depth. Review of groundwater maps of the Upper Santa Ana River Basin shows historical groundwater depths to be about 30 feet. The liquefaction evaluation conducted for the proposed project indicates a low liquefaction potential. Any associated seismic-induced settlement would be less than one inch and should occur rather uniformly across the site. Differential settlements should be less than 0.5 inch over a 50-foot (horizontal) distance in the building area. Conformance with standard engineering practices and design criteria would reduce the effects of seismic-related ground failure to less than significant levels.

4) *Landslides? **No Impact.***

Landslides are mass movements of the ground that include rock falls, relatively shallow slumping and sliding of soil, and deeper rotational or transitional movement of soil or rock. The project site is relatively flat and is not located within an area susceptible to landslides. Therefore, there would be no impact from landslides on the proposed project.

- b) *Result in substantial soil erosion or the loss of topsoil? **Less Than Significant Impact.***

Trenching during the construction phase of the project would displace soils and temporarily increase the potential for soils to be subject to wind and water erosion. However, erosion and loss of topsoil can be controlled using standard construction practices. With adherence to the applicable practices and regulations, impacts would be considered less than significant.

- c) *Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse? **Less Than Significant Impact with Mitigation Incorporated.***

As discussed above in threshold 6.a.3, the project site is in an area with low liquefaction potential. The project site is also not in an area subject to landslides. According to the Geotechnical Engineering Investigation, the site consists of fill and natural soil. Fill was encountered in some areas to a depth of six feet. The report includes recommendations to ensure that soils are appropriate for development. Implementation of Mitigation Measure G-1 would reduce potential impacts to a less than significant level.

#### **Mitigation Measure**

G-1 All grading and construction of the Project site shall comply with the geotechnical recommendations contained in the Geotechnical Engineering Investigation prepared by NorCal Engineering dated April 2015. All recommendations contained in the report shall be incorporated into all final and engineering and grading plans.

- d) *Be located on expansive soil, as defined in Table 18-1-B of the California Building Code (2013), creating substantial risks to life or property? **Less Than Significant Impact.***

The proposed project would be required to be in conformance with the 2013 California Building Code (CBC), City regulations, and other applicable standards. Conformance with standard engineering practices, design criteria and Mitigation Measure G-1 would reduce impacts related to expansive soil potential to a less than significant level.

- e) *Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater? **No Impact.***

The proposed project would not include the implementation of septic tanks or alternative wastewater disposal systems. Therefore, no impact would occur.

#### **Cumulative Impacts**

The potential cumulative impact related to earth and geology is typically site specific. The analysis herein determined that the proposed project would not result in any significant impacts related to landform modification, grading, or the destruction of a geologically significant landform or feature with implementation of mitigation. Moreover, existing State and local laws and regulations are in place to protect people and property from substantial adverse geological and soils effects, including fault rupture, strong seismic groundshaking, seismic-induced ground failure (including liquefaction), and landslides. Existing laws and regulations also protect people and property from adverse effects related to soil erosion, expansive soils, loss of topsoil, development on an unstable geologic unit or soil type that could result in on- or off-site

landslides, lateral spreading, subsidence, liquefaction, or collapse. These existing laws and regulations, along with mitigation assigned to the proposed project, would render potentially adverse geological and soil effects of the proposed project to a level of less than significant. Moreover, these existing laws and regulations also ensure that past, present, and reasonably foreseeable future projects in the San Bernardino region do not result in substantial adverse geological and soils effects. As a result, the existing legal and regulatory framework would ensure that the incremental geological and soils effects of the proposed project would not result in greater adverse cumulative effects when considered together with the effects of other past, present, and reasonably foreseeable future projects in the San Bernardino region. The impacts of the proposed project-related to geology and soils would be less than cumulatively considerable.

## 7. Greenhouse Gas Emissions

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact | No Impact                |
|--|--------------------------------|--|------------------------------|--------------------------|
| Would the project:   |                                |  |                              |                          |
| a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?      | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>     | <input type="checkbox"/> |
| b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases? | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>     | <input type="checkbox"/> |

### Discussion

- a) *Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment? **Less than Significant Impact with Mitigation Incorporated.***
- 1) An Air Quality Technical Report which also addresses greenhouse gas (GHG) emissions was prepared by Kunzman Associates, Inc. (January 2016). The results and conclusions of the report are summarized herein (Appendix A).
  - 2) The CalEEMod Version 2013.2.2 was used to calculate GHG emissions from the proposed project. The City of San Bernardino does not currently have their own Climate Action Plan; however, the City of San Bernardino is a participating member of the San Bernardino Association of Governments (SANBAG) San Bernardino County Greenhouse Gas Emissions Reduction Plan (GHG Plan). The GHG Plan was adopted on December 6, 2011 and became effective on January 6, 2012; the GHG Plan was made final on March 2014. The GHG Plan targets reducing GHG emissions to 1990 levels by 2020 by cutting approximately 30 percent from business-as-usual (BAU) emissions levels, or approximately 15 percent from year 2008 levels, which is the baseline year for the GHG Plan. The plan is consistent with AB 32 and sets the City on a path to achieve more substantial long-term reductions in the post-2020 period. Achieving this level of emissions will ensure that the contribution to greenhouse gas emissions from activities covered by the GHG Plan will not be cumulatively considerable. Per the GHG Plan, the City of San Bernardino has identified that if a project exceeds the SCAQMD screening threshold of 3,000 metric tons of carbon dioxide equivalent (MTCO<sub>2e</sub>) per year for all land use types, then a project's year 2020 emissions will be compared to the project's baseline (BAU) GHG emissions.
  - 3) The project's year 2017 (opening year) emissions were calculated and compared to the SCAQMD 3,000 MTCO<sub>2e</sub> per year GHG Plan and SCAQMD screening threshold and the SCAQMD industrial threshold of 10,000 MTCO<sub>2e</sub> per year. GHG emissions without mitigation are shown in Table 8. Without mitigation, the proposed project would generate 3,918.41 MTCO<sub>2e</sub> per year which exceeds the 3,000 MTCO<sub>2e</sub> per year screening threshold; however, the project's unmitigated emissions do not exceed the SCAQMD's 10,000 MTCO<sub>2e</sub> per year threshold for industrial uses.

- 4) As shown in Table 9, with mitigation, the project would generate 2,913.97 MTCO<sub>2</sub>e per year; less than the 3,000 metric tons of CO<sub>2</sub>e per year SCAQMD and GHG Plan screening threshold. Therefore, with incorporation of Mitigation Measures GHG-1 through 7, the operation of the proposed project would not create a significant cumulative impact to global climate change.

**Table 8: Project Greenhouse Gas Emissions Without Mitigation<sup>1</sup>**

| Category   | Greenhouse Gas Emissions (Metric Tons/Year) |                        |                 |                 |                  |                   |

**Mitigation Measures**

- GHG-1 The project applicant shall provide sidewalks within the project boundary and along the off-site roadway improvements.
- GHG-2 The project applicant shall require that any future tenants institute a ride sharing program and employee vanpool/shuttle that is open to all employees.
- GHG-3 The project applicant shall require that all building structures meet or exceed 2013 Title 24 Standards and Green Building Code Standards.
- GHG-4 The project applicant shall require that all lighting installed in the proposed structures uses on average a minimum of 5 percent less energy than conventional metal halide warehouse lighting.
- GHG-5 The project applicant shall require that all faucets, toilets and showers installed in the proposed structures utilize low-flow fixtures that would reduce indoor water demand by 20% per CalGreen Standards.
- GHG-6 The project applicant shall require that ENERGY STAR-compliant appliances are installed on site.
- GHG-7 The project applicant shall require all future tenants to institute recycling programs that reduces waste to landfills by a minimum of 50 percent (75 percent by 2020) and includes designated recycling bins at each proposed structure and requires all green waste to be processed at a recycling or composting facility.

b) *Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases? **Less than Significant Impact with Mitigation Incorporated.***

The proposed project would have the potential to conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases. As previously addressed, the City of San Bernardino is one of the 21 partnership cities that are participating in the San Bernardino Associated Governments (SANBAG) San Bernardino County Regional GHG Reduction Plan (GHG Plan). Therefore, the applicable plan for the proposed project is the SANBAG San Bernardino County GHG Plan. The GHG Plan was prepared to assist the City in conforming to the GHG emissions reductions as mandated under Assembly Bill (AB) 32.

The GHG Plan employs the San Bernardino County screening threshold of 3,000 MTCO<sub>2</sub>e per year. If the project's emissions exceed that screening threshold, then the City of San Bernardino selected a goal to reduce its community GHG emissions to a level that is 15 percent below its 2008 GHG emissions level by 2020. The City will meet and exceed this goal subject to reduction measures that are technologically feasible and cost-effective per AB 32 through a combination of State (~86%) and local (~14%) efforts. The City actually exceeds the goal with only State/county level actions (104% of goal), but has committed to several additional local measures.

The City of San Bernardino's Sustainability Master Plan Task Force, appointed by the City Council, is recommending various draft strategies for the Mayor and City Council to consider adopting. This framework of strategies is located within the Land Use and Transportation section of the Draft Sustainable Master Plan (SMP). If adopted, the Draft SMP will support the goals of SB 375 and the Sustainable Communities Strategy through a wide range of actions. The Draft SMP will include GHG reduction measures similar to but different from the measures listed in the GHG Plan. The Draft SMP measures will generally be more specific to the City of San Bernardino, but they will also support the goals of AB 32. The SMP follows the organization of the SANBAG San Bernardino County GHG Reduction Plan, with the SMP measures following the SANBAG San Bernardino County GHG Reduction Plan measures.

SCAQMD's screening thresholds used Executive Order S-3-05 goal as the basis for deriving the screening level. The California Governor issued Executive Order S-3-05, GHG Emission, in June 2005, which established the following reduction targets:

- 2010: Reduce greenhouse gas emissions to 2000 levels
- 2020: Reduce greenhouse gas emissions to 1990 levels
- 2050: Reduce greenhouse gas emissions to 80 percent below 1990 levels.

In 2006, the California State Legislature adopted AB 32, the California Global Warming Solutions Act of 2006. AB 32 requires CARB to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020 through an enforceable statewide emission cap which will be phased in starting in 2012. Therefore, if the project's emissions meet the threshold for compliance (the 3,000 MTCO<sub>2</sub>e per year screening threshold) with Executive Order S-3-05, then the project's emissions would also comply with the goals of AB 32; which is also the goal of the GHG Plan and the SMP.

At a level of 2,913.97 MTCO<sub>2</sub>e per year with mitigation, the project's GHG emissions level falls below the SCAQMD and GHG Plan screening threshold of 3,000 metric tons per year of CO<sub>2</sub>e for all land uses, and well below the SCAQMD's GHG emissions threshold of 10,000 metric tons per

year of CO<sub>2</sub>e for industrial projects. Therefore, as the projects mitigated emissions do not exceed the GHG Plan's screening threshold of 3,000 metric tons per year, the project is consistent with the applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Furthermore, the project will comply with applicable Green Building Standards and City of San Bernardino's policies regarding sustainability (as dictated by the City's General Plan and the SMP); therefore, with incorporation of mitigation measures GHG-1 through GHG-7 as detailed above in 7 a), impacts are less than significant.

### **Cumulative Impacts**

With mitigation, the project's emissions would be below the SCAQMD's threshold for GHG emissions of 3,000 metric tons per year of CO<sub>2</sub>e and an industrial project's threshold of 10,000 metric tons per year of CO<sub>2</sub>e. As discussed above, the project would not result in a cumulatively considerable impact due to GHGs.

## 8. Hazards and Hazardous Materials

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|--|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:   |                                |  |                                     |                                     |
| a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?                                   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| f. For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| h. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

### Discussion

- a) *Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? **Less Than Significant Impact.***

Prior uses on the site are not known to have involved hazardous materials. Once the project is constructed, hazardous materials would be limited to those associated with a warehouse/industrial facility. These include cleaners, paints, solvents; and fertilizers and pesticides for site landscaping. Because these materials are used in very limited quantities, they are not considered a hazard to the public. Adherence to federal, State, and local health

and safety requirements regarding these substances would reduce the potential impacts to less than significant.

- b) *Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment? **Less Than Significant Impact.***

The proposed project is not anticipated to result in a release of hazardous materials into the environment. The proposed warehouse/industrial facility would be expected to use limited hazardous materials and substances which would be limited to cleaners, paints, solvents; and fertilizers and pesticides for site landscaping. All materials and substances would be subject to applicable health and safety requirements. A less than significant impact would occur.

- c) *Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school? **No Impact.***

No schools are presently located within one-quarter mile of the project site. The closest school site is Loma Linda Academy which is located approximately 1.4 miles southeast of the project site. Any future school developed within the surrounding area will be subject to the oversight of the California Department of Toxic Substances Control, as required by State law.

- d) *Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment? **No Impact.***

The project site is not included on a hazardous sites list compiled pursuant to California Government Code Section 65962.5.<sup>2</sup> In addition, a Phase I Environmental Site Assessment was prepared for the project site by Arcadis in April 2015. According to that report, there were no Recognized Environmental Conditions (REC) (as defined by ASTM Practice E 1527-13) identified in association with the site. No significant adverse impacts relative to hazardous materials sites would result with project implementation.

- e) *For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area? **No Impact.***

San Bernardino International Airport is located approximately two miles northeast of the project site. However, the proposed project would be consistent with the surrounding area and would not create a safety hazard for people residing or working in the project area. Furthermore, the San Bernardino International Airport Authority has approved an aviation easement for the proposed project. Thus, no impact would occur.

*For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area? **No Impact.***

---

<sup>2</sup> California, State of, Department of Toxic Substances Control, DTSC's Hazardous Waste and Substances Site List - Site Cleanup (Cortese List). Available at: [http://www.dtsc.ca.gov/SiteCleanup/Cortese\\_List.cfm](http://www.dtsc.ca.gov/SiteCleanup/Cortese_List.cfm). Accessed: August 21, 2015.

The proposed project site is not located within the vicinity of a private airstrip and would not result in a safety hazard for people residing or working in the project area.

- f) *Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan? **Less Than Significant Impact.***

The proposed project would have no impacts on emergency response plans or emergency evacuation plans. The City of San Bernardino has adopted an Emergency Management Plan to identify evacuation routes, emergency facilities, and City personnel and equipment available to effectively deal with emergency situations. No revisions to the adopted Emergency Management Plan would be required as a result of the proposed project. Primary access to all major roads would be maintained during construction of the proposed project. Therefore, impacts would be less than significant.

- g) *Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands? **No Impact.***

- h) The proposed project would not expose people or structures to a risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. The project site is in a developed urban area and it is not adjacent to any wildland areas. Therefore, no impact would occur in regard to wildland fires. **No Impact.**

#### **Cumulative Impacts**

The incremental effects of the proposed project related to hazards and hazardous materials, if any, are anticipated to be minimal, and any effects would be site-specific. Therefore, the proposed project would not result in incremental effects to hazards or hazardous materials that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. The proposed project would not result in cumulatively considerable impacts to or from hazards or hazardous materials.

## 9. Hydrology and Water Quality

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:  |                                |  |                                     |                                     |
| a. Violate any water quality standards or waste discharge requirements?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| b. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| e. Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| f. Otherwise substantially degrade water quality?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| g. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| h. Place within a 100-year flood hazard area structures which would impede or redirect flood flows?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| i. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| j. Inundation by seiche, tsunami, or mudflow?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

## Discussion

Project specific Preliminary Drainage Report and a Water Quality Management Plan Stormwater Management Plan were prepared by Kimley-Horn and Associates in September 2015, to evaluate hydrology and water quality impacts associated with the proposed project. The results and conclusions of the plan are summarized herein.

- a) *Violate any water quality standards or waste discharge requirements? **Less Than Significant Impact.***

The project site is located in moderately sloped terrain that generally slopes from the northeast towards the south and southwest. Existing drainage flows are primarily shallow sheet flow, which discharges onto the golf course property to the west and southwest. Runoff within the public street sections remains in the curb and gutter along South Waterman Avenue and within the curb and gutter, asphalt concrete dike or shoulder of East Dumas Street. The proposed onsite tributary area is approximately 25.25 acres. With implementation of the proposed project, surface runoff would be directed to two onsite underground infiltration basins through a network of proposed catch basins and storm drains. The proposed onsite underground infiltration basins have been sized to capture and retain the 100-year storm event. The project site will not discharge surface waters, but will infiltrate 100% of the runoff produced within project and tributary to the onsite infiltration basins. These basins would capture and treat all storm water generated on the site; therefore, impacts to water quality would be less than significant.

To minimize water quality impacts during construction of the proposed project, construction activities would be required to comply with a Stormwater Pollution Prevention Plan (SWPPP) consistent with the General Permit for Stormwater Discharge Associated with Construction Activity (Construction Activity General Permit). The SWPPP would incorporate BMPs such as gravel bags, silt fence, and fiber rolls. Preparation and implementation of a SWPPP would reduce potential impacts to water quality during construction to less than significant.

- b) *Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)? **No Impact.***

The project does not propose to use groundwater. Although the project would result in additional impervious surfaces on-site, the project would construct two underground infiltration basins which would capture all storm water runoff from the site. Therefore, the proposed project would not significantly impact local groundwater recharge. No impacts would occur in this regard.

- c) *Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of stream or river, in a manner which would result in substantial erosion or siltation on- or off-site? **No Impact.***

The project site overland flows from the northeast/east to west/southwest. There are no existing drainage facilities on the project site. Existing runoff from the project site within South Waterman Avenue is conveyed via curb and gutter south towards the Santa Ana River. Runoff within East Dumas Street is conveyed to the west towards Twin Creek channel

through a variety of roadside improvements such as curb and gutter, asphalt concrete dike and earthen shoulders. South Waterman Avenue has an existing 36-inch storm drain main conveying flows to the south towards the Santa Ana River. There are no additional drainage systems in the area or on site. The project does not propose to discharge offsite, but rather, construct two underground infiltration basins to capture all site drainage. In addition, the site does not include any streams or rivers which could be altered by the proposed project. Therefore, no impact would occur in this regard.

- d) *Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site? **Less Than Significant Impact.***

Refer to response V.9(c) above. The proposed project would not substantially alter existing drainage patterns of the site or project vicinity. The project site does not include any streams or rivers, which could be altered by the proposed project. On-site surface runoff would be directed to the on-site underground infiltration basins. The proposed underground infiltration basins would also minimize the potential for flooding to occur on- or off-site. Impacts would be less than significant in this regard.

- e) *Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff? **Less Than Significant Impact.***

The infiltration basins were designed in accordance to the procedures and methodologies outlined in the *San Bernardino County Flood Control District Standard Plans and Detention Basin Design Criteria for San Bernardino County (1987)*. The proposed onsite underground infiltration basins have been sized to capture and retain the 100-year storm event. No impacts to the capacity of existing or planned storm water drainage system would occur as a result of the project.

The proposed project would be required to prepare a SWPPP under the NPDES General Construction Permit to implement BMPs to minimize storm water runoff during construction. Adherence with the recommendations of the Stormwater Management Plan prepared for the proposed, and preparation of a SWPPP would reduce possible impacts related to the storm water drainage system to less than significant.

- f) *Otherwise substantially degrade water quality? **Less Than Significant Impact.***

Water quality impacts other than those described in Response V.9(a) above are not anticipated with implementation of the proposed project. Impacts resulting from the project would be less than significant.

- g) *Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map? **No Impact.***

The proposed project does not propose housing. Therefore, no flood related impacts would occur in this regard.

- h) *Place within a 100-year flood hazard area structures which would impede or redirect flood flows? **No Impact.***

The project site is covered by Map Numbers 06071C8683H and 06071C8684H of the FEMA Flood Insurance Rate Map (FIRM) for San Bernardino County, California and Incorporated Areas. A majority of the project site is located within Flood Zone A, while a smaller portion in the southeast corner is located in Flood Zone X. Flood Zone A has a 1% annual change of flood hazard and Flood Zone X has a 0.2% annual chance of flood hazard. The County of San Bernardino Flood Control indicates that a building within Flood Zone A shall have a finished floor elevation or exterior waterproofing elevation of two-feet higher than the highest adjacent finished grade. The highest adjacent finished grades is near the corner of South Waterman Avenue and East Dumas Street and is approximately 1014.7. The proposed building finished floor elevation is approximately 1015.0 on the east side and slopes towards the west at 0.5% slope to an approximate elevation of 1009.4. Exterior waterproofing will be implemented to an elevation of at least 1016.7 feet. Given the project has been designed in accordance with the County's requirements, the project would not subject structures to flood hazards.

- i) *Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam? **Less Than Significant Impact.***

According to the City of San Bernardino's General Plan Safety Element, the project site is located within the Seven Oaks Dam Inundation area<sup>3</sup>. The Seven Oaks Dam is located in unincorporated San Bernardino County approximately 11 miles to the northeast of the project site. Figure S-2 in the General Plan notes that the inundation shown represents events of an extremely remote nature. Flooded area shown are based on dam failure at full pool elevation of 2,580 NGVD<sup>4</sup>. The General Plan includes policies to prohibit development within the 100 year flood plan unless adequate mitigation is provided, such as, requiring a building within Flood Zone A to have a finished floor elevation or exterior waterproofing elevation of two-feet higher than the highest adjacent finished grade. The project site would be required to adhere to the County of San Bernardino Flood Control's requirements for Zone A, as discussed above. In addition, the project does not propose any habitable structures. Adherence to federal, State, and local flood control requirements regarding flooding would reduce the potential impacts to less than significant.

- j) *Inundation by seiche, tsunami, or mudflow? **No Impact.***

The project site is located approximately 75 miles east of the Pacific Ocean and as referenced above, is approximately 11 miles downstream from the Seven Oaks Dam. There is no risk of exposure to inundation by seiche or tsunami. The project site is relatively flat so the potential for a mudflow is unlikely. Thus, no impact would occur.

### **Cumulative Impacts**

The potential impacts related to hydrology and storm water runoff are typically site specific. Furthermore, the analysis determined that the implementation of the proposed project would not result in significant impacts. As a result, no cumulative impacts are anticipated.

---

<sup>3</sup> City of San Bernardino General Plan. *Safety Element, Figure S-2 Page 10-15*. November 2005.

<sup>4</sup> City of San Bernardino General Plan. *Safety Element, Figure S-2 Page 10-15*. November 2005.

## 10. Land Use and Planning

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:  |                                |  |                                     |                                     |
| a. Physically divide an established community?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| c. Conflict with any applicable habitat conservation plan or natural community conservation plan?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

### Discussion

a) *Physically divide an established community? **No Impact.***

An example of a project that has the potential to divide an established community includes the construction of a new freeway or highway through an established neighborhood. The proposed project would be located on a site in an urban area with similar surrounding land uses. The proposed project would generally blend in with the mix of surrounding uses and would not physically divide an established community. Therefore, no impacts would occur.

b) *Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect? **Less Than Significant Impact.***

The City's General Plan land use designations for the project site are Industrial and Open Space. The City's zoning designation for the site includes: Industrial Light, Office Industrial Park, and Public Commercial Recreation. The proposed project is not consistent with the land use or zoning designations. Approval of the proposed project, therefore, includes a General Plan Amendment (GPA) and a Zoning Map Amendment (ZMA).

Project implementation requires an amendment to the General Plan and to the Zoning Map to change the General Plan land use designation to Industrial and the zoning designation to Industrial Light. With approval of the GPA and ZMA, the proposed project would be consistent with the land use and zoning designations and development standards for the project site. These amendments would not impact a plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. The amendments are required to make the proposed project fully consistent with land use and zoning designations for the project site. Furthermore, the proposed amendments would be consistent with land use designations and zoning surrounding the project site.

Therefore, the proposed project would have a less than significant impact on a plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

c) *Conflict with any applicable habitat conservation plan or natural community conservation plan? **No Impact.***

The project site is not located within an area designated as a habitat conservation plan or natural community conservation plan. Therefore, the proposed project would not conflict either form of plan.

### **Cumulative Impacts**

The analysis of potential impacts indicated that no impacts would result from the proposed project's implementation. As a result, no cumulative impacts related to land use and planning would occur.

## 11. Mineral Resources

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact | No Impact                           |
|---|--------------------------------|--|------------------------------|-------------------------------------|
| Would the project:  |                                |  |                              |                                     |
| a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?                                | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |

### Discussion

- a) *Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State? **No Impact.***

The project site is not mapped by the City as an area containing mineral resources. Therefore, the proposed project would not result in the loss of availability of a known mineral resource.

- b) *Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan? **No Impact.***

The project site is not located in an area that has been identified as a locally important mineral resource recovery site. Therefore, the proposed project would have no impact.

### Cumulative Impacts

The analysis of potential impacts indicated that no impacts would result from the proposed project. As a result, no cumulative impacts related to mineral resources would occur.

## 12. Noise

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:  |                                |  |                                     |                                     |
| a. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?   | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>            | <input type="checkbox"/>            |
| b. Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| c. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?  | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>            | <input type="checkbox"/>            |
| d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?  | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>            | <input type="checkbox"/>            |
| e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

### Discussion

A Noise Impact Assessment Technical Report was prepared by Kunzman Associates (October 2015) for the proposed project. The technical report discusses the potential operational and construction noise impacts associated with the proposed project. The results and findings are summarized herein and the report is included as Appendix E to this Initial Study.

- a) *Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? **Less Than Significant With Mitigation Incorporated.***
- d) *Substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project? **Less Than Significant With Mitigation Incorporated.***

The City noise regulations and standards are provided in the Noise Element of the General Plan and the Municipal Code. For purposes of this analysis, the Noise Element was used to evaluate traffic and stationary noise impacts from the proposed project. Because there are sensitive receptors near the project site, this analysis applies to the City's residential noise standards. The City specifies that the exterior noise levels at residential locations should not exceed 65 dBA CNEL while interior levels shall not exceed 45 dBA CNEL.

As part of the noise study prepared for the proposed project, an ambient noise level survey was conducted on September 23, 2015. Noise measurements were performed to determine the existing noise environment near noise-sensitive areas within the project area. Sound level measurement locations (MLs) were selected at three locations. Table 10 identifies the results for the noise measurements.

**Table 10: Short-Term Noise Measurements**

| Daytime                |              |      |      |      |      |      |       |       |       |
|------------------------|--------------|------|------|------|------|------|-------|-------|-------|
| Site Location          | Time Started | Leq  | Lmax | Lmin | L(2) | L(8) | L(25) | L(50) | L(90) |

### Construction

The City considers construction noise to be a short-term impact and would be considered significant if construction activities are undertaken outside the allowable times as described by the City’s Municipal Code (Section 8.54.070). Existing single-family residences located adjacent to the project site may be affected by short-term noise associated the transport of workers, the movement of construction materials to and from the project site, ground clearing, excavation, grading, and building activities.

Construction noise levels will vary depending on the construction process, type of equipment, location of construction in relationship to sensitive receptors, and the schedule and duration of the construction work. Site preparation is expected to produce the highest sustained construction noise levels. A likely worst-case construction noise scenario assuming the use of this equipment was calculated using the Federal Highway Administration's Roadway Construction Noise Model (RCNM) assuming the use of a grader, a dozer, excavator and a dump truck all operating between 75 and 250 feet from the nearest sensitive receptor. Assuming a use factor of 40 percent for each piece of equipment, unmitigated noise levels would reach 78.2 dBA Leq and 81.5 dBALmax at the nearest residential structures.

As noted, the City has an exemption for construction-related noise. However, noise reduction measures are provided to reduce temporary noise levels. These reduction measures yield up to a 10 dBA reduction in the noise such that noise levels during construction would be reduced to 68.2 dBA Leq and 71.5 dBALmax. With implementation of Mitigation Measures N-1 through 9, noise impacts during construction would be less than significant.

### On-site Operations

Sensitive receptors that may be affected by project operational noise include single-family residences to the north and west of the project site.

On-site project operational noise was modeled using the SoundPLAN model. Modeled noise sources include noise associated with parking areas, idling trucks, loading and unloading activities, trucks’ diesel engines, exhaust systems, braking, and forklifts and potential rooftop HVAC. The noisiest hour for all of these activities occurring simultaneously was modeled. The potential worst-case CNELs (assuming continuous 24-hour operation, were also calculated.

Unmitigated peak hour noise levels at nearby land uses would range between 50.5 to 62.9 dBA  $L_{eq}$  (peak hr.) and 57 to 70 CNEL. More specifically, project operational noise levels at nearby single-family residences would range from 62 to 70; from 57 to 68 at the golf course facilities; and 58 to 60 at the office buildings located east of the project site. The unmitigated operational noise levels at residences directly north of the project site will exceed the City's 65 dBA CNEL limit and therefore the project would require an eight-foot-high noise wall to reduce the noise level below the City's 65 dBA limit. With the noise wall (i.e. Mitigation Measure N-10), impacts would be mitigated to a less than significant level. The project would not impact the golf course or the office buildings.

**Noise Impacts to Off-Site Receptors Due to Project Generated Traffic**

Project-generated traffic noise was modeled using the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Traffic noise levels were calculated 50 feet from the centerline of the analyzed roadway. The modeling does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference with and without the project. In addition, the noise contours for 55, 60, 65 and 70 dBA CNEL were calculated.

The potential off-site noise impacts caused by an increase of traffic from operation of the proposed project on the nearby roadways were calculated for the following scenarios:

- Existing Conditions Without Project
- Existing Conditions With Project

Table 11 compares the without and with project scenario and shows the change in traffic noise levels as a result of the proposed project. An increase of 3 dB or more is typically required to have an audible difference. As identified in the table, the project is anticipated have a nominal change in noise levels (approximately 0 to 0.3 dBA CNEL). The change in noise level would not be audible and would be considered less than significant.

**Table 11: Change in Existing Noise Levels as a Result of the Project**

| Roadway         | Segment                           | CNEL at 50 Feet dBA      |                       |                       |                              |
|-----------------|-----------------------------------|--------------------------|-----------------------|-----------------------|------------------------------|
|                 |                                   | Existing Without Project | Existing Plus Project | Change in Noise Level | Potential Significant Impact |
| Waterman Ave    | Mill St to Central Ave            | 74.4                     | 74.4                  | 0.0                   | No                           |
|                 | Central Ave to Orange Show Rd     | 74.4                     | 74.4                  | 0.0                   | No                           |
| Valley View Ave | Mill St to Central Ave            | 61.2                     | 61.2                  | 0.0                   | No                           |
|                 | Central Ave to Orange Show Rd     | 63.9                     | 64.2                  | 0.3                   | No                           |
| Tippecanoe Ave  | Mill St to Central Ave            | 77.5                     | 77.6                  | 0.0                   | No                           |

## Mitigation Measures

### Construction

- N-1 During all project site excavation and grading on site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.
- N-2 The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.
- N-3 Equipment shall be shut off and not left to idle when not in use.
- N-4 The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.
- N-5 The project applicant shall mandate that the construction contractor prohibit the use of music or sound amplification on the project site during construction.
- N-6 The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment.
- N-7 Limit the use of heavy equipment or vibratory rollers and soil compressors along the project boundaries to the greatest degree possible. It is acknowledged that some soil compression may be necessary along the project boundaries.
- N-8 Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.
- N-9 For the duration of construction activities, the construction manager shall serve as the contact person should noise levels become disruptive to local residents. A sign should be posted at the project site with the contact phone number.

### Operational

- N-10 The project shall construct an 8-foot noise barrier along the northern project boundary in accordance with the Kunzman Noise Study. The wall shall be positioned at the top of slope or pad, whichever is greater such that it provides optimum sound attenuation.

b) *Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels? **Less Than Significant Impact.***

### Construction Vibration

The City prohibits any uses that generate a discernible vibration impact beyond the property line. The nearest existing structure to the project site is located approximately 65 feet to the north. Due to the proximity of adjacent single-family residences, project construction activities may result in groundborne vibration that is annoying but would be limited to activities within 100 feet of sensitive receptors and would only occur during site grading and preparation activities.

Ground-borne vibration will be maintained at an acceptable level through, where feasible, the use of low-vibration construction procedures such as performing earthmoving and ground-impacting operations during non-overlapping phases. All construction equipment would be located over 100 feet from vibration-sensitive land uses. The project would not require pile driving. No significant construction vibration impacts would be expected.

#### Operational Vibration

The primary source of potential vibration issues associated with the project would be truck traffic. Traffic, including heavy trucks traveling on a highway, rarely generates vibration amplitudes high enough to cause structural or cosmetic damage. However, there have been cases in which heavy trucks traveling over potholes or other discontinuities in the pavement have caused vibration high enough to result in complaints from nearby residents (Caltrans, Transportation- and Construction-Induced Vibration Guidance Manual). While the project's traffic could expose or make worse such conditions, the vibration impact would occur when any truck passed over the discontinuity. These types of issues typically can be resolved by smoothing the roadway surface. The project is not anticipated to result in a significant vibration impact.

- c) *A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project? **Less Than Significant With Mitigation Incorporated.***

Noise levels associated with the proposed project would increase over existing noise levels. However, as discussed under V.12(a) above, all noise-related impacts can be mitigated to a less than significant level.

- e) *For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels? **Less Than Significant Impact.***

San Bernardino International Airport is located approximately two miles northeast of the project site. No significant noise levels occur at the project site; no impact would occur.

- f) *For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels? **No Impact.***

The proposed project site is not located within the vicinity of a private airstrip and therefore, would not expose persons to excessive airport-related noise levels.

#### **Cumulative Impacts**

As discussed above, all construction and operational noise impacts can be mitigated to a less than significant level. Construction noise impacts are by nature localized. The distance of separation among the proposed project and other cumulative projects would be such that the temporary noise and vibration effects of the proposed project would not be compounded or increased by similar noise or vibration effects from other cumulative projects. As discussed, operational noise caused by the proposed project can be mitigated. The noise analysis performed for operation of the proposed project incorporated cumulative noise levels from forecasted traffic volumes in the study area. Other than cumulative traffic volumes, there are no past, present, or reasonably foreseeable projects that would compound or increase the operational noise levels generated by the proposed project. Therefore, cumulative impacts relative to temporary and permanent noise generation associated with the proposed project would be less than significant.

### 13. Population and Housing

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:  |                                |  |                                     |                                     |
| a. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| b. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |

#### Discussion

- a) *Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?* **No Impact.**

The project proposes the development of an industrial center and does not propose residential development. Although development of the facility would create additional job opportunities, it would not substantially induce growth in the area. Roads and infrastructure are already in place to serve the project site, and no additional roadway extensions or infrastructure would be required. As the project does not propose new residences or additional roads, there would be no substantial population growth induced by the proposed project.

- b) *Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?* **Less Than Significant Impact.** and

- c) *Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?* **Less Than Significant Impact.**

The proposed project would require the removal and displacement of five existing single-family residences on the project site. The removal of these residences does not represent a substantial displacement of people necessitating the construction of replacement housing. Although no impact would occur, the project applicant is prepared to purchase those residences at or above fair market value as a part of the project. Therefore, a less than significant impact would occur.

As discussed above in threshold 13.b, the proposed project would require the removal of existing housing on the project site, and, thus the displacement of residents of these homes. However, this consists of a relatively small number of houses, and therefore impacts would not be substantial.

## **Cumulative Impacts**

The proposed project would not result in direct or indirect permanent or temporary impacts related to population or housing. Therefore, the proposed project would not result in incremental effects to population and housing that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. As a result, no cumulative impacts related to population and housing would occur.

## 14. Public Services

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:  |                                |  |                                     |                                     |
| a. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: |                                |  |                                     |                                     |
| i. Fire protection?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| ii. Police protection?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| iii. Schools?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| iv. Parks?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| v. Other public facilities?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

### Discussion

#### 1) Fire protection? *Less Than Significant Impact.*

Fire protection services would be provided to the project site by the City of San Bernardino Fire Department. The Fire Department has 161 Emergency Operations Personnel. The Fire Department staffs 12 fire engine companies, 2 aerial truck companies, 1 heavy rescue, 5 4-wheel drive brush engines, 1 hazardous material response rig, and 1 medic squad housed in 12 stations in the City. The closest fire station to the project site is Station #231 located at 450 E. Vanderbilt Drive, approximately 0.5 mile southeast of the project site. This station houses one type 1 fire engine and the Fire Department's hazardous materials unit. According to the Fire Department, the response times are determined by the type of activity reported<sup>5</sup>.

The project site is located within the City limits and within the service area of the Fire Department. Increased development on the project site as proposed by the project may incrementally increase the demand for fire protection services to the project site, consequently, the proposed project is subject to fire suppression development impact fees. However, development will not increase to a substantial level considering the site's location and surrounding area of similar uses. Therefore, impacts would be less than significant.

---

<sup>5</sup> Written correspondence from Lieutenant Rich Lawhead, Community Affairs/PIO/Community Policing, Narcotics Division Commander, City of San Bernardino Police Department provided on 10/12/15.

2) *Police protection? **Less Than Significant Impact.***

Police protection services would be provided by the City of San Bernardino Police Department. The Police Department has 312 sworn officers and 150 non-sworn employees. The closest police station is located at 710 North D Street approximately 2.5 miles northwest of the project site. Although a new warehouse/manufacturing building would be constructed and will operate on the project site, the proposed project would be located in an urbanized area and would not result in a substantial increase in demand on police services. It is not anticipated to increase response times to the project site or vicinity. As required for a development of this type, the proposed project is subject to law enforcement development impact fees as determined by the City of San Bernardino. The project does not propose new or physically altered police protection facilities. Therefore, impacts would be less than significant.

3) *Schools? **No Impact.***

The proposed project is a non-residential land use. Implementation of the proposed project would not directly result in an increased population in the City and would therefore not increase the need for the construction of additional school facilities. Furthermore, the San Bernardino City Unified School District requires development impact fees be paid by the project applicant based on the square footage of the proposed project. Upon payment of the required fees, no significant impact to school services or facilities would occur.

4) *Parks? **Less than Significant Impact.***

The proposed project is a warehouse/manufacturing building and does not include a residential component. The proposed project would not create a significant increased demand or need for the construction of park facilities. However, construction of the proposed project would require the abandonment of the golf course driving range currently located on the project site. Based on the proximity of other golf course driving ranges in the City and surrounding area, this would represent a less than significant impact.

5) *Other public facilities? **No Impact.***

The proposed project would not result in an increase in population within the City; therefore, no impacts to other public facilities would occur with project implementation.

### **Cumulative Impacts**

The proposed project would not result in a significant impact to any public services or facilities. Therefore, the proposed project would not result in incremental effects to public services or facilities that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. The proposed project would not result in cumulatively considerable impacts to public services or facilities.

## 15. Recreation

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact | No Impact                           |
|--|--------------------------------|--|------------------------------|-------------------------------------|
| a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |
| b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?                        | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>     | <input checked="" type="checkbox"/> |

### Discussion

- a) *Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated? **No Impact.***

The project proposes a lot consolidation and development of an industrial center facility. Implementation of the proposed project would not generate an increase in demand on existing public or private parks or other recreational facilities that would either result in or increase physical deterioration of the facility. Thus, no impact would result from the proposed project.

- b) *Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment? **No Impact.***

Implementation of the proposed project would not include recreational facilities, nor would it require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment. Thus, no impact would result from the proposed project.

### Cumulative Impacts

The proposed project would not result in an increased use of recreational facilities or require construction or expansion of existing recreational facilities. Therefore, no cumulative impacts on recreational facilities would result from project implementation.

## 16. Transportation/Traffic

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:  |                                |  |                                     |                                     |
| a. | f. Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

A Traffic Impact Analysis (TIA) and Addendum were prepared by Kunzman Associates (September 2015) to assess the potential traffic impacts of the proposed project. The TIA Addendum evaluated the additional right-in/right-out driveway on South Waterman Avenue (Alternative A). With the exception of the additional right-in/right-out driveway on South Waterman Avenue, the two alternatives are the same; therefore, any analysis specific to the additional driveway is noted as Alternative A in this section. The findings of the TIA and Addendum are summarized in this Initial Study; the TIA and Addendum are provided as Appendix F.

### Discussion

- a) *Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit? **Less Than Significant With Mitigation Incorporated.***

The traffic study methodology and traffic study area were defined by the City and Kunzman Associates. The traffic study area includes seven intersections as identified below.

- E Street and Orange Show Road
- Washington Avenue at Orange Show Road
- Waterman Avenue at Orange Show Road
- Waterman Avenue at Dumas Street
- Waterman Avenue at Park Center Circle North
- Waterman Avenue at Park Center Circle South
- Waterman Avenue at Vanderbilt Way

Morning and evening peak hour traffic conditions were analyzed for the following scenarios:

- Existing Conditions (2015)
- Existing Plus Project
- Existing Plus Ambient Growth (2017)
- Opening Year (2017) Without and With Project
- Horizon Year (2035) Without and With Project

Intersection operations were evaluated using the Intersection Delay Method based on the Highway Capacity Manual - Transportation Research Board Special Report 209. To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

**Significance Criteria**

The City of San Bernardino General Plan states that peak hour intersection operations of LOS D or better are generally acceptable. Therefore, any intersection operating Level of Service E to F will be considered deficient. For freeway facilities, the definition of deficiency is based on maintaining a level of service standard of LOS E or better, except where an existing LOS F condition is identified. A deficiency is, therefore, defined as any freeway segment operating or projected to operate at LOS F, unless the segment is currently identified.

Based on the City of San Bernardino Development Services Department, *Traffic Impact Study Guidelines* (2015), the impact is considered significant if the project-related increase in the V/C ratio equals or exceeds the thresholds shown below:

| <b>Significant Impact Threshold for Intersections</b> |                        |                             |
|---|------------------------|-----------------------------|
| <b>Level of Service</b>                               | <b>Volume/Capacity</b> | <b>Incremental Increase</b> |
| C   | 0.71-0.80              | 0.04 or more                |
| D   | 0.81-0.90              | 0.02 or more                |
| E/F   | 0.91 - more            | 0.01 or more                |

An intersection mitigation measure shall either fix the deficiency, or reduce the V/C ratio so that it is below the level that occurs without the project. A traffic impact is considered significant if the project both (1) contributes measurable traffic to and (2) substantially and adversely changes the level of service at any off-site location projected to experience deficient operations under foreseeable cumulative conditions, where feasible improvements consistent with the City of San Bernardino General Plan cannot be constructed.

### Existing Conditions

Morning and evening traffic counts were conducted to determine existing intersection traffic conditions. In addition, truck classification counts were conducted at the study area intersections. The existing volumes and types of trucks (number of axles) were used in the conversion of trucks to Passenger Car Equivalents (PCEs). The following conversion rates were used: 2-axle trucks = 2.0 cars; 3-axle trucks = 2.5 cars; and 4+ axle trucks = 3.0 cars. Existing traffic conditions in the study area are identified in Table 12. As identified in the table, all traffic study area intersections are currently operating at acceptable levels of service (LOS D or better) in both the AM and PM peak hours.

**Table 12: Existing Conditions**

| Intersection   | Jurisdiction | Traffic Control <sup>2</sup> | Peak Hour          |                  |                  |                    |                  |                  |
|--|--------------|------------------------------|--------------------|------------------|------------------|--------------------|------------------|------------------|

| Vanderbilt Way (EW) - #9                                   | City of SB   | TS                           | 22.0               | C                | 0.577            | 18.6               | B                | 0.434            |

1 When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; > = Right Turn Overlap; d = De facto Right Turn.  
2 TS = Traffic Signal; CSS = Cross Street Stop  
3 Delay, level of service (LOS) and volume to capacity ratio (V/C) has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the 2000 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.  
4 LOS = Level of Service; V/C = Volume to Capacity

## Project Trip Generation

Daily and peak hour trips were estimated for the proposed project. Trip generation estimates are based on the Institute of Transportation Engineers (ITE) Trip Generation Manual (9th Edition) trip generation rates for High-Cube Warehouse, and the City of Fontana Truck Trip Generation Study (August 2003). Trip generation rates, PCE factors, and the resulting trip generation estimates are identified in Table 13. At build-out of the development, the proposed project is estimated to generate approximately 1,282 PCE vehicle trips on a daily basis, with 87 trips in the morning peak hour and 95 trips in the evening peak hour.

**Table 13: Project Trip Generation**

| Descriptor  | Quantity       | Units <sup>2</sup> | Type of Vehicle |              |              |               | Total Trucks  | Total       |

## Existing Plus Project

This section addresses the impacts associated with adding project-related trips to Existing Conditions traffic volumes. The Existing Plus Project scenario is a hypothetical scenario, which assumes that the proposed project would be fully implemented at the present time, with no other changes to area traffic volumes or to the street network serving the site. This analysis assumes full development of the project and full absorption of project traffic on the circulation system at the present time.

Project-related trips were added to existing traffic volumes to forecast Existing Plus Project conditions. A summary of the resulting intersection levels of service is provided in Table 14. Table 14 shows that all study intersections would continue to operate at a LOS D or better under this scenario, with the exception of the following intersection:

- Waterman Avenue at Park Center Circle N - #7

**Table 14: Existing Plus Project**

### Existing Plus Ambient Growth (2017)

The Existing Plus Ambient Growth (2017) delay and Level of Service for the study area roadway network without other development or the proposed project are shown in Table 15. As shown in the table, study area intersections are forecast to operate at an acceptable levels of service during the morning and evening peak hours. Under this scenario, a traffic signal is projected to be warranted at the following study area intersection:

- Waterman Avenue at Park Center Circle N- #7

**Table 15: Existing Plus Ambient Growth**

## Opening Year (2017)

**Opening Year Without Project.** To assess Opening Year (2017) traffic conditions, existing traffic is combined with ambient growth, and other development traffic. Opening Year 2017 traffic volumes have been interpolated from the Year 2035 traffic volumes based upon a proportion of the future growth increment from the San Bernardino Transportation Analysis Model (SBTAM) traffic model Year 2008 and Year 2035 average daily traffic volume forecasts. Study area intersections are forecast to operate at acceptable levels of service during the peak hours without and with improvements.

**Opening Year (2017) With Project.** Project traffic was added to the Opening Year traffic conditions to evaluate the project's contribution to study area intersections. Table 16 identifies that the study area intersections are forecast to operate at acceptable levels of service during the peak hours, except for the following intersection:

- Waterman Avenue at Park Center Circle N - #7

Measures are available to mitigate the impact to this intersection to a less than significant level.

**Table 16: Opening Year With Project**

| Intersection  | Peak Hour | Without Project |     |       | With Project |     |       |                |                                  |

## Year (2035)

**Year 2035 Without Project.** To assess Year 2035 traffic conditions, the Year 2035 Without Project daily and peak hour directional roadway segment volume forecasts have been determined using the growth increment approach on the SBTAM traffic model Year 2008 and Year 2035 peak hour volumes. This difference defines the growth in traffic over the 27-year period. Study area intersections are forecast to operate at acceptable levels of service during the peak hours without and with improvements.

**Year 2035 With Project.** Project traffic was added to the Year 2035 traffic conditions to evaluate the project's contribution to study area intersections. Table 17 identifies that the study area intersections are forecast to operate at acceptable levels of service during the peak hours, except for the following intersection:

- Waterman Avenue at Park Center Circle N - #7

Measures are available to mitigate the impact to this intersection to a less than significant level.

**Table 17: Year 2035 Without and With Project**

## Mitigation Measures

TRAF-1 Install traffic signal at Waterman Avenue and Park Center Circle North. The traffic signals within the study area should include an interconnection of the traffic signals to function in a coordinated system.

TRAF-2 As mitigation for the potential traffic impacts, the proposed project shall contribute through local and regional adopted traffic impact fee programs in addition to any fair share contributions shown within the traffic study which is not covered within these fee programs.

- b) *Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion/management agency for designated roads or highways? **Less Than Significant Impact.***

The purpose of the Congestion Management Program (CMP) is to develop a coordinated approach to managing and decreasing traffic congestion by linking the various transportation, land use, and air quality planning programs throughout the County, consistent with that of SANBAG. The CMP requires review of substantial individual projects, which might on their own impact the CMP transportation system. Specifically, the CMP Traffic Impact Analysis measures impacts of a project on the CMP Highway System. Compliance with the CMP requirements ensures a city's eligibility to compete for State gas tax funds for local transportation projects.

The CMP requires that a Traffic Impact Analysis must include analysis of any CMP arterial monitoring intersection where the proposed project will add 50 or more trips during either the AM or PM weekday peak hour; and any freeway monitoring location where the project will not add 150 or more trips, in either direction, during either the AM or PM peak hour. The proposed project would not add 50 or more trips during either the AM or PM weekday peak hour to a designated CMP intersection; and would not add 150 or more trips to any freeway mainline location, in either direction, during either the AM or PM peak hour. Therefore, the proposed project would not exceed a level of service standard established by the CMP for designated roads or highways.

- c) *Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks? **No Impact.***

The proposed project would not include any aviation components or structures where height would be an aviation concern. No associated traffic impacts would occur.

- d) *Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)? **No Impact.***

The proposed project does not involve any changes that would create new potentially hazardous conditions or incompatible uses in the project vicinity. Therefore, no impacts are anticipated.

- e) *Result in inadequate emergency access? **No Impact.***

Under Alternative A, the proposed project would provide two access points from Waterman Avenue and two points of access from Dumas Street. Alternative B would provide two access points from Dumas Street and one access point from Waterman Avenue. Constructed roadways and driveways are required to meet access standards of the San

Bernardino City Fire Department. Compliance with the Fire Department requirements would ensure impacts remain less than significant.

- f) *Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?* **No Impact.**

The proposed project has been designed to be consistent with local policies, plans, and programs supporting alternative transportation. The main alternative transportation modes available to the project would be bus transit and bicycle access. Transit service is provided by Omnitrans; Transit Route 5 operates on Waterman Avenue, and Transit Routes 2 and 15 operate on E Street. Sidewalks would be provided along the project frontages. The project would not conflict with adopted policies, plans, or programs regarding alternative modes of transportation. No impact would result.

### **Cumulative Impacts**

The TIA and Addendum address both the project-specific and the project's contribution to cumulative impacts. The project would have a significant impact to the intersection of Waterman Avenue at Park Center Circle North; this impact can be mitigated to a less than significant level.

## 17. Utilities and Service Systems

| Issues  | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                           |
|---|--------------------------------|--|-------------------------------------|-------------------------------------|
| Would the project:  |                                |  |                                     |                                     |
| a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| b. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?                            | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| c. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?                                     | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| d. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| e. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments? | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| f. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| g. Comply with federal, State, and local statutes and regulations related to solid waste?   | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |

### Discussion

- a) *Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board? **Less Than Significant Impact.***

The San Bernardino Municipal Water Department (SBMWD) treats, and disposes of all of the City's sewage at the San Bernardino Water Reclamation Plant and the Rapid Infiltration and Extraction. The SBMWD is permitted to treat 40 million gallons per a day (MGD). The average daily flow is 22 MGD<sup>6</sup>. Sanitary sewer lines that serve the project site are maintained by the City of San Bernardino and are already in place to serve the proposed project.

<sup>6</sup> Written correspondence from Michael Nevarez, Associate Engineer, San Bernardino Municipal Water Department provided on 10/07/15.

Since the City's wastewater treatment facilities are operating below the permitted capacity of 40 MGD, it is anticipated that wastewater generated by the proposed project would not result in an exceedance of any wastewater treatment requirements of the Santa Ana Regional Water Quality Control Board (RWQCB). Impacts would be considered less than significant.

- b) *Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects? **No Impact.***

Sewer and water lines are already in place to serve the project, and expansion of existing facilities or construction of new wastewater treatment facilities would not be needed for implementation of the proposed project. Therefore, there would be no impact.

- c) *Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects? **No Impact.***

Off-site street improvements for the proposed project would include curbs, gutters, and sidewalks on the south side of Dumas Street and the relocation of one storm drain inlet to outside of a proposed driveway on Waterman Avenue. Potential environmental impacts from the off-site improvements are analyzed as part of this Initial Study. According to the Water Quality Management Plan (WQMP) prepared for this project, a few landscaped areas would have vegetated swales which would connect to the nearest curb inlet within the adjacent parking lot. Through a series of curb inlets and grated inlets, storm water would be collected on site and discharged into one of two underground infiltration basins. These two basins would be the primary treatment method for the project site and are sized to contain the 100-year storm event.

The project would not require or result in the construction of new storm water drainage facilities or the expansion of existing facilities. No impacts would result.

- d) *Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed? **Less Than Significant Impact.***

The City of San Bernardino Municipal Water Department (SBMWD) provides domestic water for the City and the unincorporated areas of San Bernardino<sup>7</sup>. Buildout of the project site was anticipated in the City's General Plan and General Plan EIR and was planned for in the 2010 San Bernardino Valley Regional Urban Water Management Plan<sup>8</sup>. The City's General Plan land use designations for the project site are Industrial and Open Space. However, there is currently a golf course driving range on the land designated as open space. The Project proposes to develop the driving range only; the golf course will remain. The project proposes the entire project site be an industrial land use designation under the General Plan. Since the project would not change the land use designation in the General Plan to a more water intensive use, it would not increase the demand for water supplies on the project site beyond what has been planned for. Therefore, impacts are considered less than significant in this regard.

---

<sup>7</sup> City of San Bernardino General Plan. *Utility Element, Page 9-10.* November 2005.

<sup>8</sup> Kennedy/Jenks Consultants. 2010 San Bernardino Valley Regional Urban Water Management Plan. 2010 as amended September 2012.

On April 1, 2015, Governor Brown issued Executive Order B-29-15. Key provisions include ordering the State Water Resources Control Board to impose restrictions to achieve a 25 percent reduction in potable urban water usage through February 28, 2016; directing the California Department of Water Resources to lead a statewide initiative, in partnership with local agencies, to collectively replace 50 million square feet of lawns and ornamental turf with drought tolerant landscapes; and directing the California Energy Commission to implement a statewide appliance rebate program to provide monetary incentives for the replacement of inefficient household devices. Approval of the Project will not preclude the City from complying with this Executive Order.

- e) *Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments? **Less Than Significant Impact.***

Refer to response V.17(a) and (b) above. The wastewater infrastructure needed to serve the project site is already in place, and the City's wastewater facilities have adequate capacity to serve the project's demand. Impacts would be less than significant in this regard.

- f) *Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs? **Less Than Significant Impact.***

The City of San Bernardino Refuse and Recycling Division provides collection services to residential and commercial customers for refuse, recyclables, and green waste<sup>9</sup>. The City utilizes Materials Recovery Facilities (MRF) to manage collected waste and recyclables. The Burrtec Waste Industries, Inc. East Valley Transfer and Recycling MRF has the expansion capability to accommodate up to 10,000 tons per day. It is not anticipated that the proposed project would affect existing facilities and cause the need to construct a new facility<sup>10</sup>.

The Mid-Valley Sanitary Landfill, which serves the Valley region of San Bernardino County, has remaining capacity and is anticipated to remain open until 2033<sup>11</sup>. Therefore, impacts would be less than significant.

- g) *Comply with federal, State, and local statutes and regulations related to solid waste? **Less Than Significant Impact.***

Refer to response V.17(f) above. The Mid-Valley Landfill is a facility that has been constructed to meet all required local, State, and federal rules and regulations. The proposed project would not compromise the City's compliance with federal, State and local statutes and regulations related to solid waste. Impacts would be less than significant in this regard.

<sup>10</sup> Written correspondence from Gracie Johnson, Integrated Waste Field Inspector, City of San Bernardino provided on 10/21/15.

<sup>11</sup> CalRecycle website, "Facility/Site Summary Details: Mid-Valley Sanitary Landfill (36-AA-0055)." Accessed 12/11/15. <http://www.calrecycle.ca.gov/SWFacilities/Directory/36-AA-0055/Detail/>.

## **Cumulative Impacts**

The proposed project would have a less than significant impact with respect to utilities/service systems. The proposed project would require water and wastewater infrastructure, as well as solid waste disposal for building facility operation. Development of public utility infrastructure is part of an extensive planning process involving utility providers and jurisdictions with discretionary review authority. The coordination process associated with the preparation of development and infrastructure plans is intended to ensure that adequate resources are available to serve both individual projects and cumulative demand for resources and infrastructure as a result of cumulative growth and development in the area. Each individual project is subject to review for utility capacity to avoid unanticipated interruptions in service or inadequate supplies. Coordination with the utility companies would allow for the provision of utility service to the proposed project and other developments. The proposed project and other planned projects are subject to connection and service fees to assist in facility expansion and service improvements triggered by an increase in demand. Because of the utility planning and coordination activities described above, no significant cumulative utility impacts are anticipated.

## 18. Mandatory Findings of Significance

| Issues   | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less than Significant Impact        | No Impact                |
|--|--------------------------------|--|-------------------------------------|--------------------------|
| Would the project:   |                                |  |                                     |                          |
| a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory? | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>            | <input type="checkbox"/> |
| b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?p  | <input type="checkbox"/>       | <input checked="" type="checkbox"/>                | <input type="checkbox"/>            | <input type="checkbox"/> |
| c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?  | <input type="checkbox"/>       | <input type="checkbox"/>                           | <input checked="" type="checkbox"/> | <input type="checkbox"/> |

### Discussion

- a) *Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory? **Less Than Significant Impact with Mitigation Incorporated.***

As described throughout the analysis above, the proposed project would not result in any significant impacts to the environment that cannot be mitigated to a less than significant level through the application of uniformly applied development policies and/or standards. The proposed project would be required to implement a range of standard and uniformly applied development policies and standards, as well as implement mitigation measures identified in the analysis herein, which would reduce impacts to a less than significant level.

- b) *Does the project have impacts which are individually limited, but cumulatively considerable (Cumulatively considerable means the projects incremental effects are considerable when compared to the past, present, and future effects of other projects)? **Less Than Significant Impact with Mitigation Incorporated.***

The proposed project would result in significant impacts in the following areas: biological resources, cultural resources, geology/soils, greenhouse gas emissions, noise and transportation/traffic. A Mitigation Program has been prepared for each of these environmental issue areas in order to reduce impacts to less than significant levels.

Standard conditions would also be imposed upon the project. Other new development projects within the City would also be subject to these requirements.

All other impacts of the project were determined either to have no impact or to be less than significant, without the need for mitigation. Cumulatively, the proposed project would not result in any significant impacts that would substantially combine with impacts of other current or probable future impacts. Therefore, the proposed project, in conjunction with other future projects, would not result in any cumulatively considerable impacts.

- c) *Does the project have environmental effects which will have substantial adverse effects on human beings, directly or indirectly? **Less Than Significant Impact.***

As discussed in the respective sections, the proposed project would have no potentially significant impacts. Therefore, impacts related to adverse effects on human beings would be less than significant.

## **I. INTRODUCTION AND SETTING**

---

### **A. Purpose and Objectives**

This study was performed to address the possibility of regional and local air quality impacts, global climate change impacts, and cancer risk from diesel emissions. The objectives of the study include:

- documentation of the atmospheric setting
- discussion of criteria pollutants and greenhouse gases
- discussion of the air quality and global climate change regulatory framework
- discussion of the air quality, greenhouse gases, and cancer risk thresholds of significance
- analysis of the construction related air quality and greenhouse gas emissions
- analysis of the operations related air quality and greenhouse gas emissions
- analysis of the operations related cancer risk from diesel emissions
- recommendations for mitigation measures
- analysis of the conformity of the proposed project with the SCAQMD AQMP

The City of San Bernardino is the lead agency responsible for preparation of this air quality analysis, in accordance with the California Environmental Quality Act authorizing legislation. Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with terms unique to air quality and global climate change, a definition of terms has been provided in Appendix A.

### **B. Project Location**

The project is located on the southwest corner of the Waterman Avenue and Dumas Drive intersection in the City of San Bernardino. A vicinity map showing the project location is provided on Figure 1.

According to the SCAQMD's MATES-IV study, the project area has an estimated ambient cancer risk of 336.39 in one million. This increased cancer risk is largely due to the proximity to the I-10 and I-215 Freeways. In comparison the average cancer risk for San Bernardino County is 339 in one million.

### **C. Project Description**

The approximately 25.25 acre project site is proposed to be developed with a 564,652 square foot high-cube warehouse distribution center with 452 total parking stalls, including 281 warehouse parking spaces and 171 trailer parking spaces, and 24 bicycle stalls. The project also includes 103,585 gross square feet of landscaping. The proposed project will have access to Waterman Avenue and Dumas Drive. Figure 2 illustrates the project site plan.

**D. Phasing and Timing**

The project will be constructed in one phase. The construction of the project is expected to begin June 2016 and be completed in March 2017. The project will be operational in 2017.

**E. Sensitive Receptors in Project Vicinity**

For the purposes of a CEQA analysis, the SCAQMD considers a sensitive receptor to be a receptor such as a residence, hospital, or convalescent facility where it is possible that an individual could remain at the location for 24 hours. SCAQMD also considers land uses such as schools, child care centers, athletic facilities, and playgrounds to be sensitive receptors. Commercial and industrial facilities are not included in the definition of sensitive receptor because employees do not typically remain on-site for a full 24 hours, but are present for shorter periods of time, such as eight hours.

The nearest sensitive receptors to the project site are the single-family detached residential dwelling units on the north side of Dumas Street (approximately 65 feet from the project's northern property line), the single-family detached residential dwelling unit to the west of the project site (approximately 170 feet from the western property line). The San Bernardino Public Golf Course is located adjacent to the southern and southwestern property line.

**F. Executive Summary of Findings**

*Construction-Source Emissions*

Project construction-source emissions would not exceed applicable regional thresholds of significance established by the SCAQMD. For localized emissions, the project will not exceed applicable Localized Significance Thresholds (LSTs) established by the SCAQMD.

Project construction-source emissions would not conflict with the Basin Air Quality Management Plan (AQMP). As discussed herein, the project will comply with all applicable SCAQMD construction-source emission reduction rules and guidelines. Project construction source emissions would not cause or substantively contribute to violation of the California Ambient Air Quality Standards (CAAQS) or National Ambient Air Quality Standards (NAAQS).

Established requirements addressing construction equipment operations, and construction material use, storage, and disposal requirements act to minimize odor impacts that may result from construction activities. Moreover, construction-source odor emissions would be temporary, short-term, and intermittent in nature and would not result in persistent impacts that would affect substantial numbers of people. Potential construction-source odor impacts are therefore considered less-than-significant.

*Operational-Source Emissions*

With incorporation of mitigation measures, the project operational-sourced emissions would not exceed applicable regional thresholds of significance established by the SCAQMD. Project operational-source emissions would not result in or cause a significant localized air quality impact as discussed in the Operations-Related Local Air Quality Impacts section of this report. Additionally, project-related traffic will not cause or result in CO

concentrations exceeding applicable state and/or federal standards (CO “hotspots). The Diesel Emissions Health Risk Assessment conducted for this project showed that DPM emissions from project-related truck traffic will not cause a significantly elevated cancer risk or significant non-cancer-related health risk to nearby receptors. Project operational-source emissions would therefore not adversely affect sensitive receptors within the vicinity of the project.

With mitigation, project operational-source emissions would not conflict with the Basin Air Quality Management Plan (AQMP). The project's emissions meet SCAQMD regional thresholds and will not result in a significant cumulative impact. The project does not propose any such uses or activities that would result in potentially significant operational-source odor impacts. Potential operational-source odor impacts are therefore considered less-than significant.

Project-related GHG emissions are also considered to be less than significant, with mitigation, and the project does not conflict with the goals of the SANBAG GHG Reduction Plan for the City of San Bernardino.

Figure 1  
Project Location Map

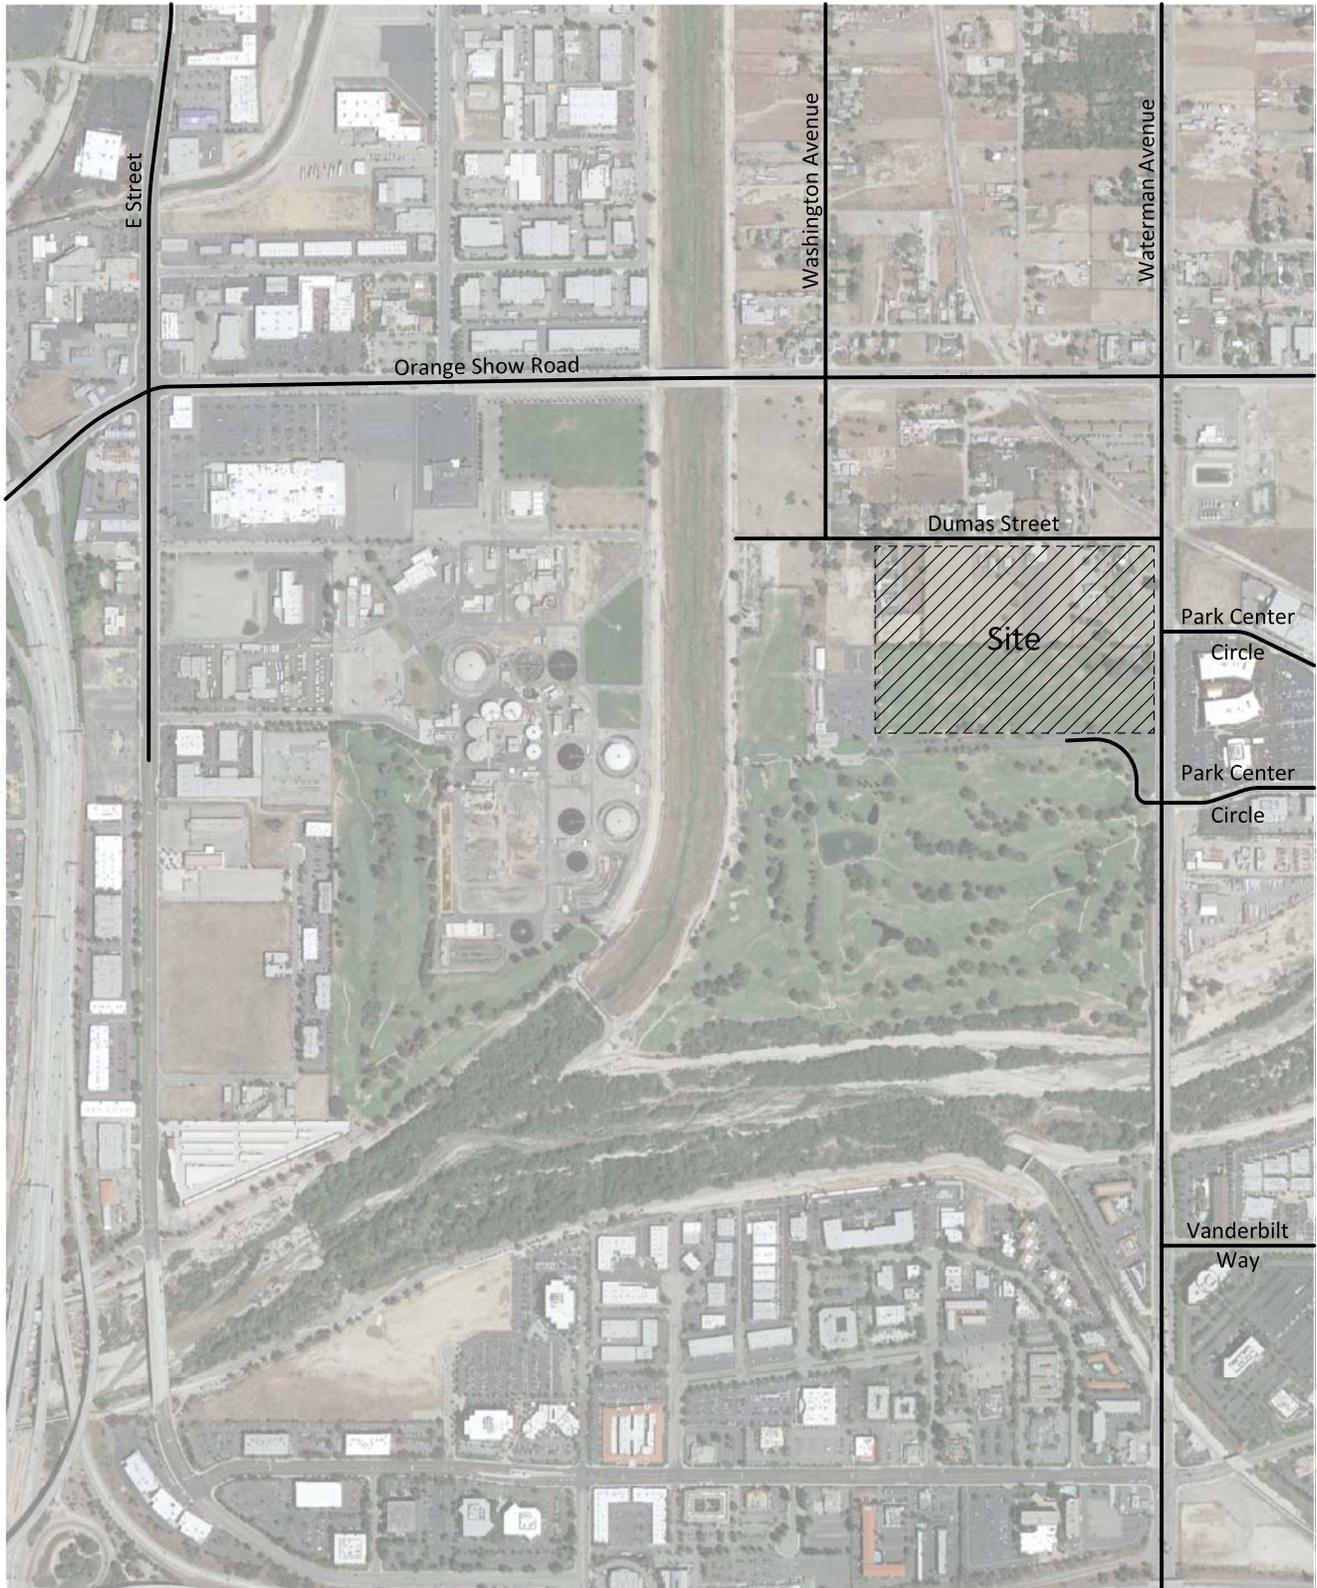

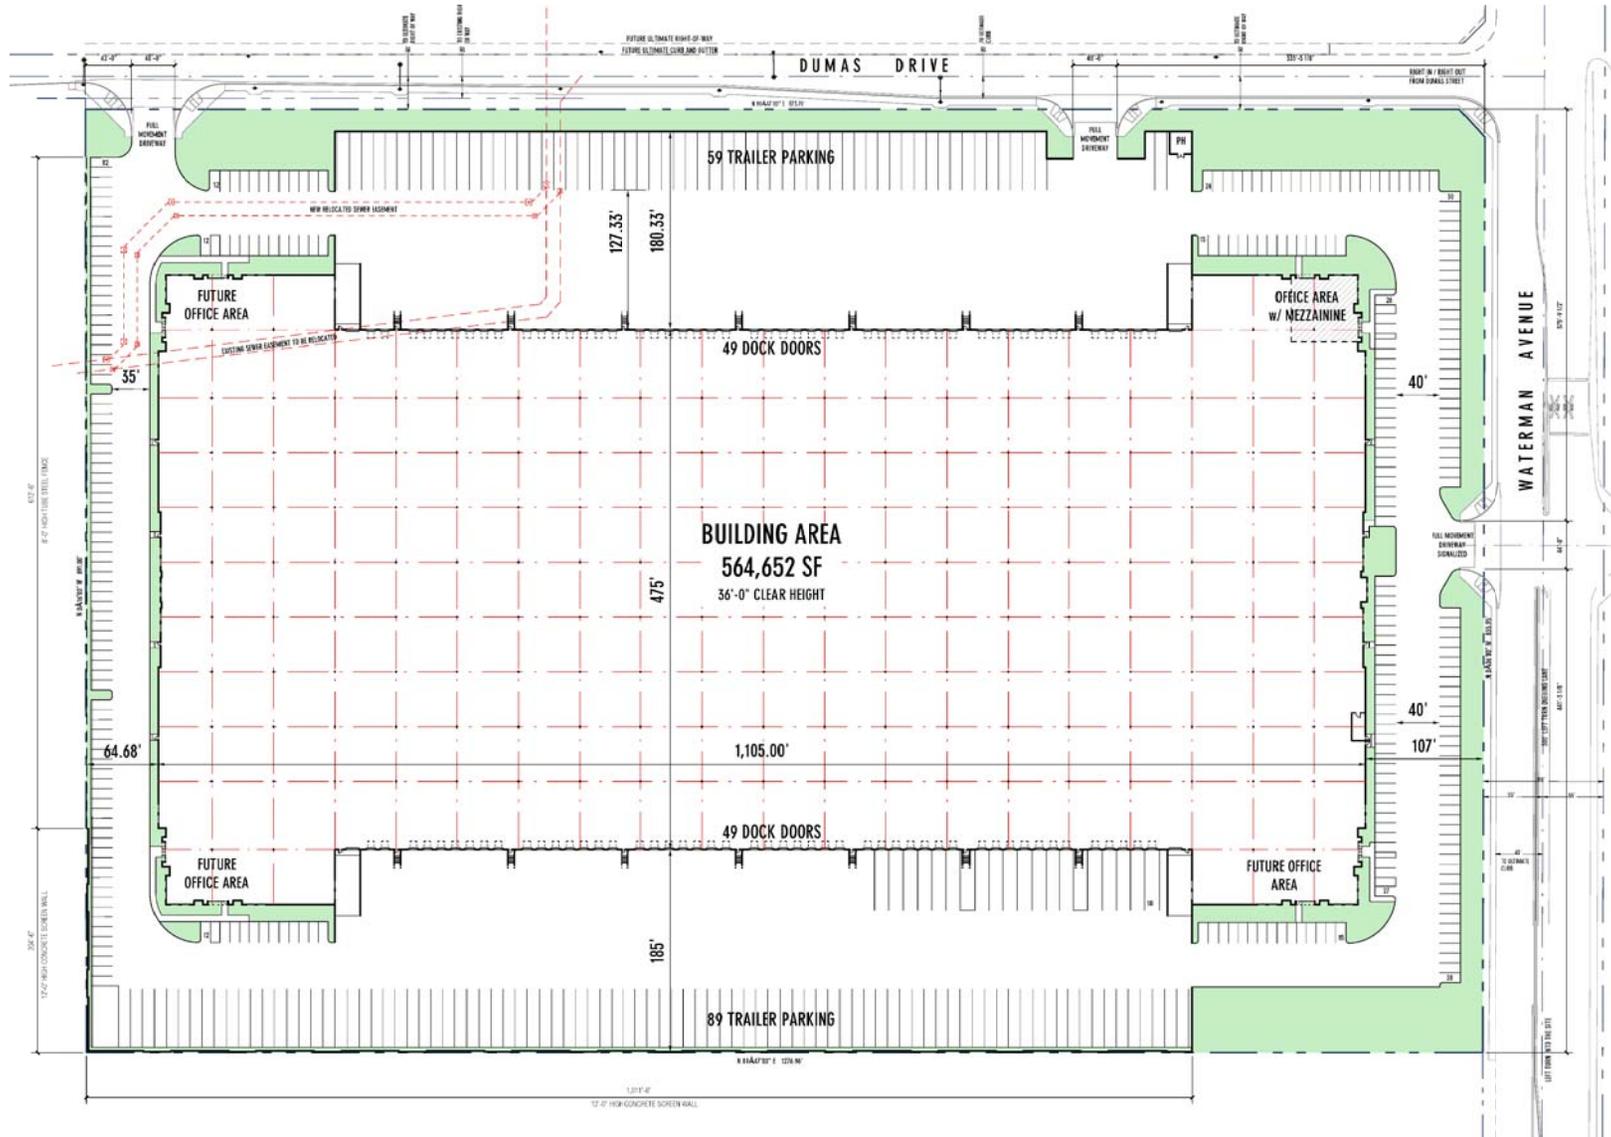

Figure 2  
Site Plan

## II. ATMOSPHERIC SETTING

---

The project site is located within the western portion of San Bernardino County, which is part of the South Coast Air Basin (SCAB) that includes all of Orange County as well as the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The South Coast Air Basin is located on a coastal plain with connecting broad valleys and low hills to the east. Regionally, the South Coast Air Basin is bounded by the Pacific Ocean to the southwest and high mountains to the east forming the inland perimeter. The project site is located toward the northeast portion of the South Coast Air Basin near the foot of the San Bernardino Mountains, which define the eastern boundary of the South Coast Air Basin.

The climate of western San Bernardino County, technically called an interior valley subclimate of the Southern California's Mediterranean-type climate, is characterized by hot dry summers, mild moist winters with infrequent rainfall, moderate afternoon breezes, and generally fair weather. Occasional periods of strong Santa Ana winds and winter storms interrupt the otherwise mild weather pattern. The clouds and fog that form along the area's coastline rarely extend as far inland as western San Bernardino County. When morning clouds and fog form, they typically burn off quickly after sunrise. The most important weather pattern from an air quality perspective is associated with the warm season airflow across the populated areas of the Los Angeles Basin. This airflow brings polluted air into western San Bernardino County late in the afternoon. This transport pattern creates unhealthy air quality that may extend to the project site particularly during the summer months.

Winds are an important parameter in characterizing the air quality environment of a project site because they both determine the regional pattern of air pollution transport and control the rate of dispersion near a source. Daytime winds in western San Bernardino County are usually light breezes from off the coast as air moves regionally onshore from the cool Pacific Ocean to the warm Mojave Desert interior of Southern California. These winds allow for good local mixing, but as discussed above, these coastal winds carry significant amounts of industrial and automobile air pollutants from the densely urbanized western portion of the South Coast Air Basin into the interior valleys which become trapped by the mountains that border the eastern edge of the South Coast Air Basin.

In the summer, strong temperature inversions may occur that limit the vertical depth through which air pollution can be dispersed. Air pollutants concentrate because they cannot rise through the inversion layer and disperse. These inversions are more common and persistent during the summer months. Over time, sunlight produces photochemical reactions within this inversion layer that creates ozone, a particularly harmful air pollutant. Occasionally, strong thermal convections occur which allows the air pollutants to rise high enough to pass over the mountains and ultimately dilute the smog cloud.

In the winter, light nocturnal winds result mainly from the drainage of cool air off of the mountains toward the valley floor while the air aloft over the valley remains warm. This forms a type of inversion known as a radiation inversion. Such winds are characterized by stagnation and poor local mixing and trap pollutants such as automobile exhaust near their source. While these inversions may lead to air pollution "hot spots" in heavily developed coastal areas of the basin, there is not enough traffic in inland valleys to cause any winter air pollution problems. Despite

light wind conditions, especially at night and in the early morning, winter is generally a period of good air quality in the project vicinity.

The temperature and precipitation levels for the City of San Bernardino are shown below in Table 1. Table 1 shows that August is typically the warmest month and December is typically the coolest month. Rainfall in the project area varies considerably in both time and space. Almost all the annual rainfall comes from the fringes of mid-latitude storms from late November to early April, with summers being almost completely dry.

### III. POLLUTANTS

---

Pollutants are generally classified as either criteria pollutants or non-criteria pollutants. Federal ambient air quality standards have been established for criteria pollutants, whereas no ambient standards have been established for non-criteria pollutants. For some criteria pollutants, separate standards have been set for different periods. Most standards have been set to protect public health. For some pollutants, standards have been based on other values (such as protection of crops, protection of materials, or avoidance of nuisance conditions). A summary of federal and state ambient air quality standards is provided in the Regulatory Framework section.

#### A. Criteria Pollutants

The criteria pollutants consist of: ozone, nitrogen dioxide, carbon monoxide, sulfur dioxide, lead, and particulate matter. These pollutants can harm your health and the environment, and cause property damage. The Environmental Protection Agency (EPA) calls these pollutants “criteria” air pollutants because it regulates them by developing human health-based and/or environmentally-based criteria for setting permissible levels. The following provides descriptions of each of the criteria pollutants.

##### 1. Nitrogen Dioxide (NO<sub>2</sub>)

Nitrogen Oxides (NO<sub>x</sub>) is the generic term for a group of highly reactive gases which contain nitrogen and oxygen. While most NO<sub>x</sub> are colorless and odorless, concentrations of nitrogen dioxide (NO<sub>2</sub>) can often be seen as a reddish-brown layer over many urban areas. NO<sub>x</sub> form when fuel is burned at high temperatures, as in a combustion process. The primary manmade sources of NO<sub>x</sub> are motor vehicles, electric utilities, and other industrial, commercial, and residential sources that burn fuel. NO<sub>x</sub> reacts with other pollutants to form, ground-level ozone, nitrate particles, acid aerosols, as well as NO<sub>2</sub>, which cause respiratory problems. NO<sub>x</sub> and the pollutants formed from NO<sub>x</sub> can be transported over long distances, following the patterns of prevailing winds. Therefore controlling NO<sub>x</sub> is often most effective if done from a regional perspective, rather than focusing on the nearest sources.

##### 2. Ozone (O<sub>3</sub>)

Ozone is not usually emitted directly into the air but at ground-level is created by a chemical reaction between NO<sub>x</sub> and volatile organic compounds (VOC) in the presence of sunlight. Motor vehicle exhaust, industrial emissions, gasoline vapors, chemical solvents as well as natural sources emit NO<sub>x</sub> and VOC that help form ozone. Ground-level ozone is the primary constituent of smog. Sunlight and hot weather cause ground-level ozone to form with the greatest concentrations usually occurring downwind from urban areas. Ozone is subsequently considered a regional pollutant. Ground-level ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and can cause substantial damage to vegetation and other materials. Because NO<sub>x</sub> and VOC are ozone precursors, the health effects associated with ozone are also indirect health effects associated with significant levels of NO<sub>x</sub> and VOC emissions.

3. Carbon Monoxide (CO)

Carbon monoxide (CO) is a colorless, odorless gas that is formed when carbon in fuel is not burned completely. It is a component of motor vehicle exhaust, which contributes about 56 percent of all CO emissions nationwide. In cities, 85 to 95 percent of all CO emissions may come from motor vehicle exhaust. Other sources of CO emissions include industrial processes (such as metals processing and chemical manufacturing), residential wood burning, and natural sources such as forest fires. Woodstoves, gas stoves, cigarette smoke, and unvented gas and kerosene space heaters are indoor sources of CO. The highest levels of CO in the outside air typically occur during the colder months of the year when inversion conditions are more frequent. The air pollution becomes trapped near the ground beneath a layer of warm air. CO is described as having only a local influence because it dissipates quickly. Since CO concentrations are strongly associated with motor vehicle emissions, high CO concentrations generally occur in the immediate vicinity of roadways with high traffic volumes and traffic congestion, active parking lots, and in automobile tunnels. Areas adjacent to heavily traveled and congested intersections are particularly susceptible to high CO concentrations.

CO is a public health concern because it combines readily with hemoglobin and thus reduces the amount of oxygen transported in the bloodstream. The health threat from lower levels of CO is most serious for those who suffer from heart disease such as angina, clogged arteries, or congestive heart failure. For a person with heart disease, a single exposure to CO at low levels may cause chest pain and reduce that person's ability to exercise; repeated exposures may contribute to other cardiovascular effects. High levels of CO can affect even healthy people. People who breathe high levels of CO can develop vision problems, reduced ability to work or learn, reduced manual dexterity, and difficulty performing complex tasks. At extremely high levels, CO is poisonous and can cause death.

4. Sulfur Dioxide (SO<sub>2</sub>)

Sulfur Oxide (SO<sub>x</sub>) gases (including sulfur dioxide [SO<sub>2</sub>]) are formed when fuel containing sulfur, such as coal and oil is burned, and from the refining of gasoline. SO<sub>x</sub> dissolves easily in water vapor to form acid and interacts with other gases and particles in the air to form sulfates and other products that can be harmful to people and the environment.

5. Lead (Pb)

Lead is a metal found naturally in the environment as well as manufactured products. The major sources of lead emissions have historically been motor vehicles and industrial sources. Due to the phase out of leaded gasoline, metal processing is now the primary source of lead emissions to the air. High levels of lead in the air are typically only found near lead smelters, waste incinerators, utilities, and lead-acid battery manufacturers. Exposure of fetuses, infants and children to low levels of lead can adversely affect the development and function of the central nervous system,

leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure.

6. Particulate Matter (PM)

Particulate matter (PM) is the term for a mixture of solid particles and liquid droplets found in the air. Particulate matter is made up of a number of components including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. The size of particles is directly linked to their potential for causing health problems. Particles that are less than 10 micrometers in diameter (PM<sub>10</sub>) are the particles that generally pass through the throat and nose and enter the lungs. Once inhaled, these particles can affect the heart and lungs and cause serious health effects. Particles that are less than 2.5 micrometers in diameter (PM<sub>2.5</sub>) have been designated as a subset of PM<sub>10</sub> due to their increased negative health impacts and its ability to remain suspended in the air longer and travel further.

7. Volatile Organic Compounds (VOCs)

Although not a criteria pollutant, reactive organic gases (ROGs), or VOCs, are defined as any compound of carbon—excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate—that participates in atmospheric photochemical reactions. Although there are slight differences in the definition of ROGs and VOCs, the two terms are often used interchangeably. Indoor sources of VOCs include paints, solvents, aerosol sprays, cleansers, tobacco smoke, etc. Outdoor sources of VOCs are from combustion and fuel evaporation. A reduction in VOC emissions reduces certain chemical reactions that contribute to the formulation of ozone. VOCs are transformed into organic aerosols in the atmosphere, which contribute to higher PM<sub>10</sub> and lower visibility.

**B. Other Pollutants of Concern**

1. Toxic Air Contaminants

In addition to the above-listed criteria pollutants, toxic air contaminants (TACs) are another group of pollutants of concern. Sources of toxic air contaminants include industrial processes such as petroleum refining and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. Cars and trucks release at least forty different toxic air contaminants. The most important of these toxic air contaminants, in terms of health risk, are diesel particulates, benzene, formaldehyde, 1,3-butadiene, and acetaldehyde. Public exposure to toxic air contaminants can result from emissions from normal operations as well as accidental releases. Health effects of toxic air contaminants include cancer, birth defects, neurological damage, and death.

Toxic air contaminants are less pervasive in the urban atmosphere than criteria air pollutants, however they are linked to short-term (acute) or long-term (chronic or carcinogenic) adverse human health effects. There are hundreds of different types of

toxic air contaminants with varying degrees of toxicity. Sources of toxic air contaminants include industrial processes, commercial operations (e.g., gasoline stations and dry cleaners), and motor vehicle exhaust.

According to the 2005 California Almanac of Emissions and Air Quality, the majority of the estimated health risk from toxic air contaminants can be attributed to relatively few compounds, the most important of which is diesel particulate matter (DPM). Diesel particulate matter is a subset of PM<sub>2.5</sub> because the size of diesel particles are typically 2.5 microns and smaller. The identification of diesel particulate matter as a toxic air contaminant in 1998 led the California Air Resources Board (CARB) to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-fueled Engines and Vehicles in September 2000. The plan's goals are a 75-percent reduction in diesel particulate matter by 2010 and an 85-percent reduction by 2020 from the 2000 baseline. Diesel engines emit a complex mixture of air pollutants, composed of gaseous and solid material. The visible emissions in diesel exhaust are known as particulate matter or PM, which includes carbon particles or "soot." Diesel exhaust also contains a variety of harmful gases and over 40 other cancer-causing substances. California's identification of diesel particulate matter as a toxic air contaminant was based on its potential to cause cancer, premature deaths, and other health problems. Exposure to diesel particulate matter is a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. Overall, diesel engine emissions are responsible for the majority of California's potential airborne cancer risk from combustion sources.

## 2. Asbestos

Asbestos is listed as a TAC by ARB and as a Hazardous Air Pollutant by the EPA. Asbestos occurs naturally in mineral formations and crushing or breaking these rocks, through construction or other means, can release asbestiform fibers into the air. Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. The risk of disease is dependent upon the intensity and duration of exposure. When inhaled, asbestos fibers may remain in the lungs and with time may be linked to such diseases as asbestosis, lung cancer, and mesothelioma. Naturally occurring asbestos is not present in San Bernardino County. The nearest likely locations of naturally occurring asbestos, as identified in the General Location Guide for Ultramafic Rocks in California prepared by the California Division of Mines and Geology, is located in Santa Barbara County. Due to the distance to the nearest natural occurrences of asbestos, the project site is not likely to contain asbestos.

## C. Greenhouse Gases

Constituent gases of the Earth's atmosphere, called atmospheric greenhouse gases (GHG), play a critical role in the Earth's radiation amount by trapping infrared radiation emitted from the Earth's surface, which otherwise would have escaped to space. Prominent greenhouse gases contributing to this process include carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), ozone, water vapor, nitrous oxide (N<sub>2</sub>O), and chlorofluorocarbons (CFCs). This phenomenon, known as the Greenhouse Effect, is responsible for maintaining a habitable

climate. Anthropogenic (caused or produced by humans) emissions of these greenhouse gases in excess of natural ambient concentrations are responsible for the enhancement of the Greenhouse Effect and have led to a trend of unnatural warming of the Earth's natural climate, known as global warming or climate change. Emissions of gases that induce global warming are attributable to human activities associated with industrial/manufacturing, agriculture, utilities, transportation, and residential land uses. Transportation is responsible for 41 percent of the State's greenhouse gas emissions, followed by electricity generation. Emissions of CO<sub>2</sub> and nitrous oxide (NO<sub>x</sub>) are byproducts of fossil fuel combustion. Methane, a potent greenhouse gas, results from off-gassing associated with agricultural practices and landfills. Sinks of CO<sub>2</sub>, where CO<sub>2</sub> is stored outside of the atmosphere, include uptake by vegetation and dissolution into the ocean. The following provides a description of each of the greenhouse gases and their global warming potential.

1. Water Vapor

Water vapor is the most abundant, important, and variable GHG in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. The feedback loop in which water is involved in is critically important to projecting future climate change. As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to "hold" more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive feedback loop." The extent to which this positive feedback loop will continue is unknown as there is also dynamics that put the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it will eventually also condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the Earth's surface and heat it up).

2. Carbon Dioxide

The natural production and absorption of CO<sub>2</sub> is achieved through the terrestrial biosphere and the ocean. However, humankind has altered the natural carbon cycle by burning coal, oil, natural gas, and wood. Since the industrial revolution began in the mid 1700s. Each of these activities has increased in scale and distribution. CO<sub>2</sub> was the first GHG demonstrated to be increasing in atmospheric concentration with the first conclusive measurements being made in the last half of the 20th century. Prior to the industrial revolution, concentrations were fairly stable at 280 parts per million (ppm). The International Panel on Climate Change (IPCC) indicates that concentrations were 379 ppm in 2005, an increase of more than 30 percent. Left unchecked, the IPCC projects that concentration of carbon dioxide in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of

anthropogenic sources. This could result in an average global temperature rise of at least two degrees Celsius.

3. Methane

CH<sub>4</sub> is an extremely effective absorber of radiation, although its atmospheric concentration is less than that of CO<sub>2</sub>. Its lifetime in the atmosphere is brief (10 to 12 years), compared to some other GHGs (such as CO<sub>2</sub>, N<sub>2</sub>O, and Chlorofluorocarbons (CFCs)). CH<sub>4</sub> has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of methane. Other anthropogenic sources include fossil-fuel combustion and biomass burning.

4. Nitrous Oxide

Concentrations of N<sub>2</sub>O also began to rise at the beginning of the industrial revolution. In 1998, the global concentration was 314 parts per billion (ppb). N<sub>2</sub>O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used as an aerosol spray propellant (i.e., in whipped cream bottles, in potato chip bags to keep chips fresh, and in rocket engines and in race cars).

5. Chlorofluorocarbons

CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane (C<sub>2</sub>H<sub>6</sub>) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the Earth's surface). CFCs have no natural source, but were first synthesized in 1928. It was used for refrigerants, aerosol propellants, and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken. This effort was extremely successful, and the levels of the major CFCs are now remaining level or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years.

6. Hydrofluorocarbons

HFCs are synthetic man-made chemicals that are used as a substitute for CFCs. Out of all the GHGs, they are one of three groups with the highest global warming potential. The HFCs with the largest measured atmospheric abundances are (in order), HFC-23 (CHF<sub>3</sub>), HFC-134a (CF<sub>3</sub>CH<sub>2</sub>F), and HFC-152a (CH<sub>3</sub>CHF<sub>2</sub>). Prior to 1990, the only significant emissions were HFC-23. HFC-134a use is increasing due to its use as a refrigerant. Concentrations of HFC-23 HFC-134a are now about 10 parts per trillion (ppt) each. Concentrations of HFC-152a are about 1 ppt. HFCs are manmade for applications such as automobile air conditioners and refrigerants.

7. Perfluorocarbons

PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth's surface are able to destroy the compounds. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF<sub>4</sub>) and hexafluoroethane (C<sub>2</sub>F<sub>6</sub>). Concentrations of CF<sub>4</sub> in the atmosphere are over 70 ppt. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing.

8. Sulfur Hexafluoride

SF<sub>6</sub> is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF<sub>6</sub> has the highest global warming potential of any gas evaluated; 23,900 times that of CO<sub>2</sub>. Concentrations in the 1990s were about 4 ppt. Sulfur hexafluoride is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

9. Aerosols

Aerosols are particles emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light. Cloud formation can also be affected by aerosols. Sulfate aerosols are emitted when fuel containing sulfur is burned. Black carbon (or soot) is emitted during biomass burning due to the incomplete combustion of fossil fuels. Particulate matter regulation has been lowering aerosol concentrations in the United States; however, global concentrations are likely increasing.

10. Global Warming Potential

GHGs have varying global warming potential (GWP). The global warming potential is the potential of a gas or aerosol to trap heat in the atmosphere; it is the cumulative radiative forcing effects of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to the reference gas, CO<sub>2</sub>. One teragram of carbon dioxide equivalent (Tg CO<sub>2</sub>e) is essentially the emissions of the gas multiplied by the global warming potential. One teragram is equal to one million metric tons. The carbon dioxide equivalent is a good way to assess emissions because it gives weight to the global warming potential of the gas. A summary of the atmospheric lifetime and the global warming potential of selected gases are summarized in Table 2. As shown in Table 2, the global warming potential of GHGs ranges from 1 to 22,800.

**Table 2****Global Warming Potentials and Atmospheric Lifetimes<sup>1</sup>**

| Gas                                     | Atmospheric Lifetime | Global Warming Potential <sup>2</sup><br>(100 Year Horizon) |
|---|----------------------|---|
| Carbon Dioxide (CO <sub>2</sub> )       | — <sup>3</sup>       | 1   |
| Methane (CH <sub>4</sub> )              | 12                   | 28-36   |
| Nitrous Oxide (NO)                      | 114                  | 298   |
| Hydrofluorocarbons (HFCs)               | 1-270                | 12-14,800   |
| Perfluorocarbons (PFCs)                 | 2,600-50,000         | 7,390-12,200  |
| Nitrogen trifluoride (NF <sub>3</sub> ) | 740                  | 17,200  |
| Sulfur Hexafluoride (SF <sub>6</sub> )  | 3,200                | 22,800  |

<sup>1</sup> Source: <http://www3.epa.gov/climatechange/ghgemissions/gases.html>

<sup>2</sup> Compared to the same quantity of CO<sub>2</sub> emissions.

<sup>3</sup> Carbon dioxide's lifetime is poorly defined because the gas is not destroyed over time, but instead moves among different parts of the ocean-atmosphere-land system. Some of the excess carbon dioxide will be absorbed quickly (for example, by the ocean surface), but some will remain in the atmosphere for thousands of years, due in part to the very slow process by which carbon is transferred to ocean sediments.

## IV. AIR QUALITY MANAGEMENT

---

### A. Regulatory Setting

The proposed project is addressed through the efforts of various international, federal, state, regional, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for improving the air quality are discussed below.

#### 1. International

In 1988, the United Nations established the Intergovernmental Panel on Climate Change (IPCC) to evaluate the impacts of global climate change and to develop strategies that nations could implement to curtail global climate change. In 1992, the United States joined other countries around the world in signing the United Nations' Framework Convention on Climate Change (UNFCCC) agreement with the goal of controlling GHG emissions. As a result, the Climate Change Action Plan was developed to address the reduction of GHGs in the United States. The plan consists of more than 50 voluntary programs.

Additionally, the Montreal Protocol was originally signed in 1987 and substantially amended in 1990 and 1992. The Montreal Protocol stipulates that the production and consumption of compounds that deplete ozone in the stratosphere—CFCs, halons, carbon tetrachloride, and methyl chloroform—were to be phased out, with the first three by 2000 and methyl chloroform by 2005.

#### 2. Federal - United States Environmental Protection Agency

The United States Environmental Protection Agency (EPA) is responsible for setting and enforcing the National Ambient Air Quality Standards (NAAQS) for atmospheric pollutants. It regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain locomotives. The National Ambient Air Quality Standards (NAAQS) pollutants were identified using medical evidence and are shown below in Table 3.

As part of its enforcement responsibilities, the EPA requires each state with federal nonattainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain the national standards. The State Implementation Plan (SIP) must integrate federal, state, and local components and regulations to identify specific measures to reduce pollution, using a combination of performance standards and market-based programs within the timeframe identified in the State Implementation Plan (SIP).

As indicated below in Table 4, the Basin has been designated by the EPA as a non-attainment area for ozone (O<sub>3</sub>) and suspended particulates (PM<sub>10</sub> and PM<sub>2.5</sub>).

Currently, the Basin is in attainment with the ambient air quality standards for carbon monoxide (CO), lead, sulfur dioxide (SO<sub>2</sub>), and nitrogen dioxide (NO<sub>2</sub>).

In 2011, the Basin exceeded federal standards for either ozone or PM<sub>2.5</sub> at one or more locations on a total of 124 days, based on the current federal standards for 8-hour ozone and 24-hour PM<sub>2.5</sub>. Despite substantial improvements in air quality over the past few decades, some air monitoring stations in the Basin still exceed the NAAQS for ozone more frequently than any other stations in the U.S. In 2011, three of the top five stations that exceeded the 8-hour ozone NAAQS were located in the Basin (Central San Bernardino Mountains, East San Bernardino Valley, and Metropolitan Riverside County).

PM<sub>2.5</sub> in the Basin has improved significantly in recent years, with 2010 and 2011 being the cleanest years on record. In 2011, only one station in the Basin (Metropolitan Riverside County at Mira Loma) exceeded the annual PM<sub>2.5</sub> NAAQS and the 98th percentile form of the 24-hour PM<sub>2.5</sub> NAAQS, as well as the 3-year design values for these standards. Basin-wide, the federal PM<sub>2.5</sub> 24-hour standard level was exceeded in 2011 on 17 sampling days.

The Basin is currently in attainment for the federal standards for carbon monoxide (CO), lead, sulfur dioxide (SO<sub>2</sub>), and nitrogen dioxide (NO<sub>2</sub>). While the concentration level of the new 1-hour NO<sub>2</sub> federal standard (100 ppb) was exceeded in the Basin at two stations (Central Los Angeles and Long Beach) on the same day in 2011, the NAAQS NO<sub>2</sub> design value has not been exceeded. Therefore, the Basin remains in attainment of the NO<sub>2</sub> NAAQS.

The EPA designated the Los Angeles County portion of the Basin as nonattainment for the recently revised (2008) federal lead standard (0.15 µg/m<sup>3</sup>, rolling 3-month average), due to the addition of source-specific monitoring under the new federal regulation. This designation was based on two source-specific monitors in Vernon and the City of Industry exceeding the new standard in the 2007-2009 period of data used.

In *Massachusetts v. Environmental Protection Agency* (Docket No. 05–1120), argued November 29, 2006 and decided April 2, 2007, the U.S. Supreme Court held that not only did the EPA have authority to regulate greenhouse gases, but the EPA's reasons for not regulating this area did not fit the statutory requirements. As such, the U.S. Supreme Court ruled that the EPA should be required to regulate CO<sub>2</sub> and other greenhouse gases as pollutants under the federal Clean Air Act (CAA).

In response to the FY2008 Consolidations Appropriations Act (H.R. 2764; Public Law 110-161), EPA proposed a rule on March 10, 2009 that requires mandatory reporting of GHG emissions from large sources in the United States. On September 22, 2009, the Final Mandatory Reporting of GHG Rule was signed and published in the Federal Register on October 30, 2009. The rule became effective on December 29, 2009. This rule requires suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to EPA.

On December 7, 2009, the EPA Administrator signed two distinct findings under section 202(a) of the Clean Air Act. One is an endangerment finding that finds concentrations of the six GHGs in the atmosphere threaten the public health and welfare of current and future generations. The other is a cause or contribute finding, that finds emissions from new motor vehicles and new motor vehicle engines contribute to the GHG pollution which threatens public health and welfare. These actions will not themselves impose any requirements on industry or other entities. However, it is a prerequisite to finalizing the EPA's proposed GHG emission standards for light-duty vehicles, which were jointly proposed by the EPA and Department of Transportation on September 15, 2009.

On March 19, 2015, the Whitehouse announced that President Obama will issue an Executive Order that will cut the Federal Government's greenhouse gas (GHG) emissions 40 percent over the next decade from 2008 levels -- saving taxpayers up to \$18 billion in avoided energy costs -- and increase the share of electricity the Federal Government consumes from renewable sources to 30 percent. Complementing this effort, several major Federal suppliers are announcing commitments to cut their own GHG emissions. Today, the Administration is hosting a roundtable that will bring some of these large Federal suppliers together to discuss the benefits of their GHG reduction targets or to make their first-ever corporate commitments to disclose emissions and set new reduction goals.

Together, the combined results of the Federal Government actions and new supplier commitments will reduce GHG emissions by 26 million metric tons by 2025 from 2008 levels, the equivalent of taking nearly 5.5 million cars off the road for a year. And to encourage continued progress across the Federal supply chain, the Administration is releasing a new scorecard to publicly track self-reported emissions disclosure and progress for all major Federal suppliers, who together represent more than \$187 billion in Federal spending and account for more than 40 percent of all Federal contract dollars.

Since the Federal Government is the single largest consumer of energy in the Nation, Federal emissions reductions and progress across the supply chain will have broad impacts. The new commitments announced today support the United States' international commitment to cut net GHG emissions 26-28 percent below 2005 levels by 2025, which President Obama first announced in November 2014 as part of an historic agreement with China. Additionally, the goals build on the strong progress made by Federal agencies during the first six years of the Administration under President Obama's 2009 Executive Order on Federal Leadership on Environmental, Energy and Economic Performance, including reducing Federal GHG emissions by 17 percent — which helped Federal agencies avoid \$1.8 billion in cumulative energy costs — and increasing the share of renewable energy consumption to 9 percent.<sup>1</sup>

3. State – California Air Resources Board

The California Air Resources Board (CARB), which is a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, the CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, provides oversight of local programs, and prepares the State Implementation Plan (SIP). The California Ambient Air Quality Standards (CAAQS) for criteria pollutants are shown in Table 3. In addition, the CARB establishes emission standards for motor vehicles sold in California, consumer products (e.g., hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

The South Coast Air Basin has been designated by the CARB as a nonattainment area for ozone, PM10 and PM2.5. Currently, the South Coast Air Basin is in attainment with the ambient air quality standards for CO, lead, SO<sub>2</sub>, NO<sub>2</sub>, and sulfates and is unclassified for visibility reducing particles and Hydrogen Sulfide.

On June 20, 2002, the CARB revised the PM10 annual average standard to 20 µg/m<sup>3</sup> and established an annual average standard for PM2.5 of 12 µg/m<sup>3</sup>. These standards were approved by the Office of Administrative Law in June 2003 and are now effective. On September 27, 2007 CARB approved the South Coast Air Basin and the Coachella Valley 2007 Air Quality Management Plan for Attaining the Federal 8-hour Ozone and PM2.5 Standards. The plan projected attainment for the 8-hour Ozone standard by 2024 and the PM2.5 standard in 2015.

The CARB is also responsible for regulations pertaining to toxic air contaminants. The Air Toxics “Hot Spots” Information and Assessment Act (AB 2588, 1987, Connelly) was enacted in 1987 as a means to establish a formal air toxics emission inventory risk quantification program. AB 2588, as amended, establishes a process that requires stationary sources to report the type and quantities of certain substances their facilities routinely release into the South Coast Air Basin. The data is ranked by high, intermediate, and low categories, which are determined by: the potency, toxicity, quantity, volume, and proximity of the facility to nearby receptors.

CARB also proposed interim statewide CEQA thresholds for GHG emissions and released Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases under the California Environmental Quality Act, on October 24, 2008. The State currently has no regulations that establish ambient air quality standards for GHGs. However, the State has passed laws directing CARB to develop actions to reduce GHG emissions, which are listed below.

*Assembly Bill 1493*

California Assembly Bill 1493 enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. In 2005, the CARB submitted a “waiver” request to the EPA from a portion of the federal Clean Air Act in order to allow the State to set more

stringent tailpipe emission standards for CO<sub>2</sub> and other GHG emissions from passenger vehicles and light duty trucks. On December 19, 2007 the EPA announced that it denied the “waiver” request. On January 21, 2009, CARB submitted a letter to the EPA administrator regarding the State’s request to reconsider the waiver denial. The EPA approved the waiver on June 30, 2009.

#### *Executive Order S-3-05*

The California Governor issued Executive Order S-3-05, GHG Emission, in June 2005, which established the following reduction targets:

- 2010: Reduce greenhouse gas emissions to 2000 levels
- 2020: Reduce greenhouse gas emissions to 1990 levels
- 2050: Reduce greenhouse gas emissions to 80 percent below 1990 levels.

The executive order directed the secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multi-agency effort to reduce GHG emissions to the target levels. To comply with the Executive Order, the secretary of CalEPA created the California Climate Action Team (CAT), made up of members from various state agencies and commissions. The team released its first report in March 2006. The report proposed to achieve the targets by building on the voluntary actions of businesses, local governments, and communities and through State incentive and regulatory programs.

#### *Assembly Bill 32*

In 2006, the California State Legislature adopted Assembly Bill 32 (AB 32), the California Global Warming Solutions Act of 2006. AB 32 requires CARB, to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020 through an enforceable statewide emission cap which will be phased in starting in 2012. Emission reductions shall include carbon sequestration projects that would remove carbon from the atmosphere and best management practices that are technologically feasible and cost effective.

On December 6, 2007 CARB released the calculated Year 1990 GHG emissions of 427 million metric tons of CO<sub>2</sub>e (MMTCO<sub>2</sub>e). The 2020 target of 427 MMTCO<sub>2</sub>e requires the reduction of 169 MMTCO<sub>2</sub>e, or approximately 30 percent from the State’s projected 2020 business as usual emissions of 596 MMTCO<sub>2</sub>e and the reduction of 42 MMTCO<sub>2</sub>e, or almost 10 percent from the 2002-2004 average GHG emissions. Under AB 32, CARB was required to adopt regulations by January 1, 2011 to achieve reductions in GHGs to meet the 1990 cap by 2020. Early measures CARB took to lower GHG emissions included requiring operators of the largest industrial facilities that emit 25,000 metric tons of CO<sub>2</sub> in a calendar year to submit verification of GHG emissions by December 1, 2010. The CARB Board also approved nine discrete early action measures that include regulations affecting landfills, motor vehicle fuels, refrigerants in cars, port operations and other sources that became enforceable on or before January 1, 2010.

On December 11, 2008 the CARB Board approved a Scoping Plan, with final adoption May 11, 2009 that proposed a variety of measures including direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, a market-based cap-and-trade system, and a fee regulation to fund the program. In current pending litigation, *Association of Irrigated Residents v. California Air Resources Board*, a California State trial court found that the analysis of the alternatives identified in the AB 32 Scoping Plan Functional Equivalent Document (FED) was not sufficient for informed decision-making and public review under CEQA. In response, CARB has appealed the decision. In addition, CARB prepared the *Supplement to the AB 32 Scoping Plan Functional Equivalent Document*, June 13, 2011. On August 24, 2011 CARB recertified the complete AB 32 Scoping Plan Functional Equivalent Environmental Document revised by the Final Supplement. In December, 2011 the Final Supplement was accepted as sufficient to fulfill the trial court's March order.

#### *Senate Bill 1368*

Senate Bill 1368 (SB 1368) is the companion Bill of AB 32 and was adopted September, 2006. SB 1368 requires the California Public Utilities Commission (CPUC) to establish a performance standard for baseload generation of GHG emissions by investor-owned utilities by February 1, 2007 and for local publicly owned utilities by June 30, 2007. These standards could not exceed the GHG emissions rate from a baseload combined-cycle, natural gas-fired plant. Furthermore, the legislation states that all electricity provided to the State, including imported electricity, must be generated by plants that meet the standards set by California Public Utilities Commission (CPUC) and California Energy Commission (CEC).

#### *Executive Order S-1-07*

Executive Order S-1-07 was issued in 2007 and proclaims that the transportation sector is the main source of GHG emissions in the State, since it generates more than 40 percent of the State's GHG emissions. It establishes a goal to reduce the carbon intensity of transportation fuels sold in the State by at least ten percent by 2020. This Order also directs CARB to determine whether this Low Carbon Fuel Standard (LCFS) could be adopted as a discrete early-action measure as part of the effort to meet the mandates in AB 32.

On April 23, 2009 CARB approved the proposed regulation to implement the low carbon fuel standard. The low carbon fuel standard is anticipated to reduce GHG emissions by about 16 MMT per year by 2020. The low carbon fuel standard is designed to provide a framework that uses market mechanisms to spur the steady introduction of lower carbon fuels. The framework establishes performance standards that fuel producers and importers must meet each year beginning in 2011. Separate standards are established for gasoline and diesel fuels and the alternative fuels that can replace each. The standards are "back-loaded", with more reductions required in the last five years, than the first five years. This schedule allows for the development of advanced fuels that are lower in carbon than today's fuels and the market penetration of plug-in hybrid

electric vehicles, battery electric vehicles, fuel cell vehicles, and flexible fuel vehicles. It is anticipated that compliance with the low carbon fuel standard will be based on a combination of both lower carbon fuels and more efficient vehicles.

Reformulated gasoline mixed with corn-derived ethanol at ten percent by volume and low sulfur diesel fuel represent the baseline fuels. Lower carbon fuels may be ethanol, biodiesel, renewable diesel, or blends of these fuels with gasoline or diesel as appropriate. Compressed natural gas and liquefied natural gas also may be low carbon fuels. Hydrogen and electricity, when used in fuel cells or electric vehicles are also considered as low carbon fuels for the low carbon fuel standard.

#### *Senate Bill 97*

Senate Bill 97 (SB 97) was adopted August 2007 and acknowledges that climate change is a prominent environmental issue that requires analysis under CEQA. SB 97 directed the Governor's Office of Planning and Research (OPR), which is part of the State Resource Agency, to prepare, develop, and transmit to CARB guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, by July 1, 2009. The Resources Agency was required to certify and adopt those guidelines by January 1, 2010.

Pursuant to the requirements of SB 97 as stated above, on December 30, 2009 the Natural Resources Agency adopted amendments to the state CEQA guidelines that address GHG emissions. The CEQA Guidelines Amendments changed 14 sections of the CEQA Guidelines and incorporate GHG language throughout the Guidelines. However, no GHG emissions thresholds of significance are provided and no specific mitigation measures are identified. The GHG emission reduction amendments went into effect on March 18, 2010 and are summarized below:

- Climate action plans and other greenhouse gas reduction plans can be used to determine whether a project has significant impacts, based upon its compliance with the plan.
- Local governments are encouraged to quantify the greenhouse gas emissions of proposed projects, noting that they have the freedom to select the models and methodologies that best meet their needs and circumstances. The section also recommends consideration of several qualitative factors that may be used in the determination of significance, such as the extent to which the given project complies with state, regional, or local GHG reduction plans and policies. OPR does not set or dictate specific thresholds of significance. Consistent with existing CEQA Guidelines, OPR encourages local governments to develop and publish their own thresholds of significance for GHG impacts assessment.
- When creating their own thresholds of significance, local governments may consider the thresholds of significance adopted or recommended by other public agencies, or recommended by experts.

- New amendments include guidelines for determining methods to mitigate the effects of greenhouse gas emissions in Appendix F of the CEQA Guidelines.
- OPR is clear to state that “to qualify as mitigation, specific measures from an existing plan must be identified and incorporated into the project; general compliance with a plan, by itself, is not mitigation”.
- OPR’s emphasizes the advantages of analyzing GHG impacts on an institutional, programmatic level. OPR therefore approves tiering of environmental analyses and highlights some benefits of such an approach.
- Environmental impact reports (EIRs) must specifically consider a project's energy use and energy efficiency potential.

*Senate Bills 1078, 107, and X1-2 and Executive Orders S-14-08 and S-21-09*

Senate Bill 1078 (SB 1078) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017. Senate Bill 107 (SB 107) changed the target date to 2010. Executive Order S-14-08 was signed on November 2008 and expands the State’s Renewable Energy Standard to 33 percent renewable energy by 2020. Executive Order S-21-09 directed CARB to adopt regulations by July 31, 2010 to enforce S-14-08. Senate Bill X1-2 codifies the 33 percent renewable energy requirement by 2020.

*Senate Bill 375*

Senate Bill 375 (SB 375) was adopted September 2008 and aligns regional transportation planning efforts, regional GHG emission reduction targets, and land use and housing allocation. SB 375 requires Metropolitan Planning Organizations (MPO) to adopt a sustainable communities strategy (SCS) or alternate planning strategy (APS) that will prescribe land use allocation in that MPOs Regional Transportation Plan (RTP). CARB, in consultation with each MPO, will provide each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035. These reduction targets will be updated every eight years but can be updated every four years if advancements in emissions technologies affect the reduction strategies to achieve the targets. CARB is also charged with reviewing each MPO’s sustainable communities strategy or alternate planning strategy for consistency with its assigned targets.

The proposed project is located within the Southern California Association of Governments (SCAG), which has authority to develop the SCS or APS. For the SCAG region, the targets set by CARB are at eight percent below 2005 per capita GHG emissions levels by 2020 and 13 percent below 2005 per capita GHG emissions levels by 2035. On April 4, 2012, SCAG adopted the 2012-2035 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS), which meets the CARB emission reduction requirements. The Housing Element Update is required by the State to be completed within 18 months after RTP/SCS adoption or by October 2013.

City and County land use policies, including General Plans, are not required to be consistent with the RTP and associated SCS or APS. However, new provisions of CEQA would incentivize, through streamlining and other provisions, qualified projects that are consistent with an approved SCS or APS and categorized as “transit priority projects”.

*Senate Bill X7-7*

Senate Bill X7-7 (SB X7-7), enacted on November 9, 2009, mandates water conservation targets and efficiency improvements for urban and agricultural water suppliers. SB X7-7 requires the Department of Water Resources (DWR) to develop a task force and technical panel to develop alternative best management practices for the water sector. In addition SB X7-7 required the DWR to develop criteria for baseline uses for residential, commercial, and industrial uses for both indoor and landscaped area uses. The DWR was also required to develop targets and regulations that achieve a statewide 20 percent reduction in water usage.

*Assembly Bill 939 and Senate Bill 1374*

Assembly Bill 939 (AB 939) requires that each jurisdiction in California to divert at least 50 percent of its waste away from landfills, whether through waste reduction, recycling or other means. Senate Bill 1374 (SB 1374) requires the California Integrated Waste Management Board to adopt a model ordinance by March 1, 2004 suitable for adoption by any local agency to require 50 to 75 percent diversion of construction and demolition of waste materials from landfills.

*California Code of Regulations (CCR) Title 24, Part 6*

CCR Title 24, Part 6: California’s Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24) were first established in 1978 in response to a legislative mandate to reduce California’s energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. Although it was not originally intended to reduce GHG emissions, electricity production by fossil fuels results in GHG emissions and energy efficient buildings require less electricity. Therefore, increased energy efficiency results in decreased GHG emissions.

The Energy Commission adopted 2008 Standards on April 23, 2008 and Building Standards Commission approved them for publication on September 11, 2008. These updates became effective on August 1, 2009. CalEEMod modeling defaults to 2008 standards. 2013 Standards have been approved and became effective July 1, 2014.

*California Code of Regulations (CCR) Title 24, Part 11*

All buildings for which an application for a building permit is submitted on or after January 1, 2014 must follow the 2013 standards. The 2013 commercial standards are estimated to be 30 percent more efficient than the 2008 standards; residential standards are 25 percent more efficient. Energy efficient

buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases greenhouse gas emissions.

#### *California Green Building Standards*

On January 12, 2010, the State Building Standards Commission unanimously adopted updates to the California Green Building Standards Code, which went into effect on January 1, 2011. The Code is a comprehensive and uniform regulatory code for all residential, commercial and school buildings. CCR Title 24, Part 11: California Green Building Standards (Title 24) became effective in 2001 in response to continued efforts to reduce GHG emissions associated with energy consumption. CCR Title 24, Part 11 now require that new buildings reduce water consumption, employ building commissioning to increase building system efficiencies, divert construction waste from landfills, and install low pollutant-emitting finish materials. One focus of CCR Title 24, Part 11 is water conservation measures, which reduce GHG emissions by reducing electrical consumption associated with pumping and treating water. CCR Title 24, Part 11 has approximately 52 nonresidential mandatory measures and an additional 130 provisions for optional use. Some key mandatory measures for commercial occupancies include specified parking for clean air vehicles, a 20 percent reduction of potable water use within buildings, a 50 percent construction waste diversion from landfills, use of building finish materials that emit low levels of volatile organic compounds, and commissioning for new, nonresidential buildings over 10,000 square feet.

The California Green Building Standards Code does not prevent a local jurisdiction from adopting a more stringent code as state law provides methods for local enhancements. The Code recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided they provide a minimum 50-percent diversion requirement. The code also provides exemptions for areas not served by construction and demolition recycling infrastructure. State building code provides the minimum standard that buildings need to meet in order to be certified for occupancy. Enforcement is generally through the local building official.

#### 4. Regional

The SCAQMD is the agency principally responsible for comprehensive air pollution control in the South Coast Air Basin. To that end, as a regional agency, the SCAQMD works directly with the Southern California Association of Governments (SCAG), county transportation commissions, and local governments and cooperates actively with all federal and state agencies. SCAMD defines a "sensitive receptor" as a land use such as residences, schools, child care centers, athletic facilities, playgrounds, retirement homes and convalescent homes.

#### *South Coast Air Quality Management District*

The SCAQMD develops rules and regulations, establishes permitting requirements for stationary sources, inspects emission sources, and enforces such measures through

educational programs or fines, when necessary. The SCAQMD is directly responsible for reducing emissions from stationary, mobile, and indirect sources. It has responded to this requirement by preparing a sequence of AQMPs. A revised draft of the 2012 AQMP was released on September, 2012, and was adopted by the SCAQMD Board on December 7, 2012. The 2012 AQMP is now awaiting approval from CARB and the U.S. EPA. The 2012 AQMP is being prepared in order to meet the federal Clean Air Act requirement that all 24-hour PM<sub>2.5</sub> non-attainment areas prepare a SIP, which was required to be submitted to the U.S. EPA by December 14, 2012 and demonstrate attainment with the 24-hour PM<sub>2.5</sub> standard by 2014. The 2012 AQMP demonstrates attainment of the federal 24-hour PM<sub>2.5</sub> standard by 2014 in the Basin through adoption of all feasible measures, and therefore, no extension of the attainment date is needed.

The 2007 AQMP demonstrated attainment with the 1997 8-hour ozone (80 ppb) standard by 2023, through implementation of future improvements in control techniques and technologies. These “black box” emissions reductions represent 65 percent of the remaining NO<sub>x</sub> emission reductions by 2023 in order to show attainment with the 1997 8-hour ozone NAAQS. Given the magnitude of these needed emissions reductions, additional NO<sub>x</sub> control measures have been provided in this AQMP even though the primary purpose of this AQMP is to show compliance with 24-hour PM<sub>2.5</sub> emissions standards.

The 2012 AQMP is designed to satisfy the California Clean Air Act’s (CCAA) emission reductions of 5 percent per year or adoption of all feasible measures requirements and fulfill the EPA’s requirement to update transportation conformity emissions budgets based on the latest approved motor vehicle emissions model and planning assumptions. The 2012 AQMP updates and revises the previous 2007 AQMP. The 2012 AQMP was prepared to comply with the Federal and State CCAA and amendments, to accommodate growth, to reduce the high pollutant levels in the Basin, to meet Federal and State ambient air quality standards, and to minimize the fiscal impact that pollution control measures have on the local economy. The purpose of the 2012 AQMP for the Basin is to set forth a comprehensive program that will lead this area into compliance with all federal and state air-quality planning requirements.

The 2012 AQMP builds upon the approaches taken in the 2007 AQMP for the attainment of federal PM and ozone standards, and highlights the significant amount of reductions needed and the need to engage in interagency coordinated planning of mobile sources to meet all of the federal criteria pollutant standards. Compared with the 2007 AQMP, the 2012 AQMP utilizes revised emissions inventory projections that use 2008 as the base year. On-road emissions are calculated using CARB EMFAC2011 emission factors and the transportation activity data provided by SCAG from their 2012 Regional Transportation Plan (2012 RTP). Off-road emissions were updated using CARB’s 2011 In-Use Off-Road Fleet Inventory Model. Since the 2007 AQMP was finalized new area source categories such as LPG transmission losses, storage tank and pipeline cleaning and degassing, and architectural colorants, were created and included in the emissions inventories. The 2012 AQMP also includes analysis of

several additional sources of GHG emissions such as landfills and could also assist in reaching the GHG target goals in the AB32 Scoping Plan.

The control measures in the 2012 AQMP consist of three components: 1) Basin-wide and episodic short-term PM<sub>2.5</sub> measures; 2) Section 182(e)(5) implementation measures; and 3) Transportation control measures. Many of the control measures are not based on command and control regulations, but instead focus on incentives, outreach, and education to bring about emissions reductions through voluntary participation and behavioral changes. More broadly, a transition to zero- and near-zero emission technologies is necessary to meet 2023 and 2032 air quality standards and 2050 climate goals. Many of the same technologies will address both air quality and climate needs.

During construction and operation, the project must comply with applicable rules and regulations. The following are rules the project may be required to comply with, either directly, or indirectly:

**SCAQMD Rule 402** prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

**SCAQMD Rule 403** governs emissions of fugitive dust during construction and operation activities. Compliance with this rule is achieved through application of standard Best Management Practices, such as application of water or chemical stabilizers to disturbed soils, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 miles per hour, sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph, and establishing a permanent ground cover on finished sites.

Rule 403 requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off-site. Applicable dust suppression techniques from Rule 403 are summarized below. Implementation of these dust suppression techniques can reduce the fugitive dust generation (and thus the PM<sub>10</sub> component). Compliance with these rules would reduce impacts on nearby sensitive receptors. Rule 403 measures may include but are not limited to the following:

- Apply nontoxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for 10 days or more).
- Water active sites at least three times daily. (Locations where grading is to occur will be thoroughly watered prior to earthmoving.)

- Cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meters (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicle Code section 23114.
- Reduce traffic speeds on all unpaved roads to 15 miles per hour (mph) or less.
- Suspension of all grading activities when wind speeds (including instantaneous wind gusts) exceed 25 mph.
- Bumper strips or similar best management practices shall be provided where vehicles enter and exit the construction site onto paved roads or wash off trucks and any equipment leaving the site each trip.
- Replanting disturbed areas as soon as practical.
- During all construction activities, construction contractors shall sweep on-site and off-site streets if silt is carried to adjacent public thoroughfares, to reduce the amount of particulate matter on public streets. All sweepers shall be compliant with SCAQMD Rule 1186.1, Less Polluting Sweepers.

**SCAQMD Rule 445** prohibits permanently installed wood burning devices into any new development. A wood burning device means any fireplace, wood burning heater, or pellet-fueled wood heater, or any similarly enclosed, permanently installed, indoor or outdoor device burning any solid fuel for aesthetic or space-heating purposes, which has a heat input of less than one million British thermal units per hour.

**SCAQMD Rule 481** applies to all spray painting and spray coating operations and equipment. The rule states that a person shall not use or operate any spray painting or spray coating equipment unless one of the following conditions is met:

- (1) The spray coating equipment is operated inside a control enclosure, which is approved by the Executive Officer. Any control enclosure for which an application for permit for new construction, alteration, or change of ownership or location is submitted after the date of adoption of this rule shall be exhausted only through filters at a design face velocity not less than 100 feet per minute nor greater than 300 feet per minute, or through a water wash system designed to be equally effective for the purpose of air pollution control.
- (2) Coatings are applied with high-volume low-pressure, electrostatic and/or airless spray equipment.
- (3) An alternative method of coating application or control is used which has effectiveness equal to or greater than the equipment specified in the rule.

**SCAQMD Rule 1108** governs the sale, use, and manufacturing of asphalt and limits the volatile organic compound (VOC) content in asphalt used in the South Coast Air Basin. This rule would regulate the VOC content of asphalt used during construction. Therefore, all asphalt used during construction of the project must comply with SCAQMD Rule 1108.

**SCAQMD Rule 1113** governs the sale, use, and manufacturing of architectural coating and limits the VOC content in paints and paint solvents. This rule regulates the VOC content of paints available during construction. Therefore, all paints and solvents used during construction and operation of the project must comply with SCAQMD Rule 1113.

**SCAQMD Rule 1143** governs the manufacture, sale, and use of paint thinners and solvents used in thinning of coating materials, cleaning of coating application equipment, and other solvent cleaning operations by limiting their VOC content. This rule regulates the VOC content of solvents used during construction. Solvents used during the construction phase must comply with this rule.

**SCAQMD Rule 1186** limits the presence of fugitive dust on paved and unpaved roads and sets certification protocols and requirements for street sweepers that are under contract to provide sweeping services to any federal, state, county, agency or special district such as water, air, sanitation, transit, or school district.

**SCAQMD Rule 1303** governs the permitting of re-located or new major emission sources, requiring Best Available Control Measures and setting significance limits for PM<sub>10</sub> among other pollutants.

**SCAQMD Rule 1401**, New Source Review of Toxic Air Contaminants, specifies limits for maximum individual cancer risk, cancer burden, and non-cancer acute and chronic hazard index from new permit units, relocations, or modifications to existing permit units, which emit toxic air contaminants.

**SCAQMD Rule 2202**, On-Road Motor Vehicle Mitigation Options, is to provide employers with a menu of options to reduce mobile source emissions generated from employee commutes, to comply with federal and state Clean Air Act requirements, Health & Safety Code Section 40458, and Section 182(d)(1)(B) of the federal Clean Air Act. It applies to any employer who employs 250 or more employees on a full or part-time basis at a worksite for a consecutive six-month period calculated as a monthly average.

In order to assist local agencies with direction on GHG emissions, the SCAQMD organized a working group and adopted Rules 2700, 2701, 2702, and 3002 which are described below.

#### **Rules 2700 and 2701**

The SCAQMD adopted Rules 2700 and 2701 on December 5, 2008, which establishes the administrative structure for a voluntary program designed to quantify GHG emission reductions. Rule 2701 provides specific protocols for private parties to follow

to generate certified GHG emission reductions for projects within the district. Approved protocols include forest projects, urban tree planting, and manure management. The SCAQMD is currently developing additional protocols for other reduction measures. For a GHG emission reduction project to qualify, it must be verified and certified by the SCAQMD Executive Officer, who has 60 days to approve or deny the Plan. Upon approval of the Plan, the Executive Officer issues required to issue a certified receipt of the GHG emission reductions within 90 days.

#### **Rule 2702**

The SCAQMD adopted Rule 2702 on February 6, 2009, which establishes a voluntary air quality investment program from which SCAQMD can collect funds from parties that desire certified GHG emission reductions, pool those funds, and use them to purchase or fund GHG emission reduction projects within two years, unless extended by the Governing Board. Priority will be given to projects that result in co-benefit emission reductions of GHG emissions and criteria or toxic air pollutants within environmental justice areas. Further, this voluntary program may compete with the cap-and-trade program identified for implementation in CARB's Scoping Plan, or a Federal cap and trade program.

#### **Rule 3002**

The SCAQMD amended Rule 3002 on November 5, 2010 to include facilities that emit greater than 100,000 tons per year of CO<sub>2</sub>e are required to apply for a Title V permit by July 1, 2011. A Title V permit is for facilities that are considered major sources of emissions.

Although the SCAQMD is responsible for regional air quality planning efforts, it does not have the authority to directly regulate air quality issues associated with plans and new development projects throughout the South Coast Air Basin. Instead, this is controlled through local jurisdictions in accordance to the California Environmental Quality Act (CEQA). In order to assist local jurisdictions with air quality compliance issues the CEQA Air Quality Handbook (SCAQMD CEQA Handbook), prepared by the SCAQMD, 1993, with the most current updates found at <http://www.aqmd.gov/ceqa/hdbk.html>, was developed in accordance with the projections and programs of the AQMP. The purpose of the SCAQMD CEQA Handbook is to assist Lead Agencies, as well as consultants, project proponents, and other interested parties in evaluating a proposed project's potential air quality impacts. Specifically, the SCAQMD CEQA Handbook explains the procedures that the SCAQMD recommends be followed for the environmental review process required by CEQA. The SCAQMD CEQA Handbook provides direction on how to evaluate potential air quality impacts, how to determine whether these impacts are significant, and how to mitigate these impacts. The SCAQMD intends that by providing this guidance, the air quality impacts of plans and development proposals will be analyzed accurately and consistently throughout the South Coast Air Basin, and adverse impacts will be minimized.

#### **SCAQMD Stakeholder Working Group**

Since neither CARB nor the OPR has developed GHG emissions threshold, the SCAQMD formed a Working Group to develop significance thresholds related to GHG emissions.

At the September 28, 2010 Working Group meeting, the SCAQMD released its most current version of the draft GHG emissions thresholds, which recommends a tiered approach that provides a quantitative annual thresholds of 10,000 MTCO<sub>2</sub>e for industrial uses.

*Southern California Association of Governments*

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino and Imperial Counties and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG is the Federally designated MPO for the majority of the southern California region and is the largest MPO in the nation. With respect to air quality planning, SCAG has prepared the Regional Transportation Plan and Regional Transportation Improvement Plan (RTIP), which addresses regional development and growth forecasts. These plans form the basis for the land use and transportation components of the AQMP, which are utilized in the preparation of air quality forecasts and in the consistency analysis included in the AQMP. The Regional Transportation Plan, Regional Transportation Improvement Plan, and AQMP are based on projections originating within the City and County General Plans.

5. Local – City of San Bernardino

Local jurisdictions, such as the City of San Bernardino, have the authority and responsibility to reduce air pollution through its police power and decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City is also responsible for the implementation of transportation control measures as outlined in the 2007 and 2012 AQMP. Examples of such measures include bus turnouts, energy-efficient streetlights, and synchronized traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation.

In accordance with the CEQA requirements, the City does not, however, have the expertise to develop plans, programs, procedures, and methodologies to ensure that air quality within the City and region will meet federal and state standards. Instead, the County relies on the expertise of the SCAQMD and utilizes the SCAQMD CEQA Handbook as the guidance document for the environmental review of plans and development proposals within its jurisdiction.

The Natural Resources and Conservation Element of the City of San Bernardino General Plan contains the following air quality-related goals and policies that are applicable to the proposed project:

Goal 12.5: Promote air quality that is compatible with the health, well-being, and enjoyment of life.

Policy 12.5.1: Reduce the emission of pollutants including carbon monoxide, oxides of nitrogen, photochemical smog, and sulfate in

accordance with South Coast Air Quality Management District (SCAQMD) standards.

Policy 12.5.2: Prohibit the development of land uses (e.g., heavy manufacturing) that will contribute significantly to air quality degradation, unless sufficient mitigation measures are undertaken according to SCAQMD standards.

Policy 12.5.3: Require dust abatement measures during grading and construction operations.

Policy 12.5.4: Evaluate the air emissions of industrial land uses to ensure that they will not impact adjacent uses.

Goal 12.6: Reduce the amount of vehicular emissions in San Bernardino County.

Policy 12.6.1: Promote a pattern of land uses which locates residential uses in close proximity to employment and commercial services and provides, to the fullest extent possible, local job opportunities and commercial service to minimize vehicular travel and associated air emissions.

Policy 12.6.4: Facilitate the development of centralized parking lots and structures in commercial districts to promote walking between individual businesses in lieu of the use of automobiles. (LU-1)

Policy 12.6.5: Require qualifying development to implement or participate in transportation demand management programs, which provide incentives for car pooling, van pools, and the use of public transit and employ other trip reduction techniques (consistent with the Circulation Element and South Coast Air Quality Management Plan).

Policy 12.6.7: Promote the use of public transit and alternative travel modes to reduce air emissions.

Goal 12.7: Participate in regional initiatives and programs to improve the South Coast Basin's air quality.

Policy 12.7.1: Cooperate with the South Coast Air Quality Management District and incorporate pertinent local implementation provisions of the Air Quality Management Plan.

Policy 12.7.2: Work with the South Coast Air Quality Management District to establish controls and monitor uses in the City that could add to the air basin's degradation (e.g., auto repair, manufacturers).

- Policy 12.7.3: Coordinate with SCAQMD to ensure that all elements of air quality plans regarding reduction of air pollutant emissions are being enforced.
- Policy 12.7.4: Work with the other cities in the South Coast Air Basin to implement regional mechanisms to reduce air emissions and improve air quality.
- Policy 12.7.5: Support legislation that promotes cleaner industry, clean fuel vehicles, and more efficient burning engines and fuels.
- Policy 12.7.6: Encourage, publicly recognize, and reward innovative approaches to improve air quality.
- Policy 12.7.7: Involve environmental groups, the business community, special interests, and the general public in the formulation and implementation of programs that actively reduce airborne pollutants.

**B. Monitored Air Quality**

The air quality at any site is dependent on the regional air quality and local pollutant sources. Regional air quality is determined by the release of pollutants throughout the air basin. Estimates of the existing emissions in the Basin provided in the Revised Draft 2012 Air Quality Management Plan, prepared by SCAQMD, September 2012, indicate that collectively, mobile sources account for 59 percent of the VOC, 88 percent of the NOx emissions and 40 percent of directly emitted PM2.5, with another 10 percent of PM2.5 from road dust.

The SCAQMD has divided the South Coast Air Basin into 38 air-monitoring areas with a designated ambient air monitoring station representative of each area. The project site is located in source receptor area 34 (SRA 34), which is located in San Bernardino County and covers the area from just west of Fontana to Loma Linda. The nearest air monitoring station to the project site is the San Bernardino 4th Street Monitoring Station (San Bernardino Station). The San Bernardino Station is located approximately 2.02 miles northeast of the project site at 24302 East 4th Street, San Bernardino. Table 5 presents the monitored pollutant levels from the San Bernardino Station. However, it should be noted that due to the air monitoring station distance from the project site, recorded air pollution levels at the air monitoring station reflect with varying degrees of accuracy, local air quality conditions at the project site.

The monitoring data presented in Table 5 shows that ozone and particulate matter (PM10 and PM2.5) are the air pollutants of primary concern in the project area, which are detailed below. Where state and federal emissions are exceeded, the values have been bolded.

**Ozone**

During the 2012 to 2014 monitoring period, the State 1-hour concentration standard for ozone has been exceeded between 22 and 41 days each year at the San Bernardino Station.

The State 8-hour ozone standard has been exceeded between 53 and 77 days each year over the past three years at the San Bernardino Station. The Federal 8-hour ozone standard was exceeded between 36 and 54 days each year over the past five years at the San Bernardino Station.

Ozone is a secondary pollutant as it is not directly emitted. Ozone is the result of chemical reactions between other pollutants, most importantly hydrocarbons and NO<sub>2</sub>, which occur only in the presence of bright sunlight. Pollutants emitted from upwind cities react during transport downwind to produce the oxidant concentrations experienced in the area. Many areas of the SCAQMD contribute to the ozone levels experienced at the monitoring station, with the more significant areas being those directly upwind.

#### **Carbon Monoxide**

CO is another important pollutant that is due mainly to motor vehicles. The San Bernardino Station did not record an exceedance of the state or federal 1-hour or 8-hour CO standards for the last five years.

#### **Nitrogen Dioxide**

The San Bernardino Station did not record an exceedance of the State or Federal NO<sub>2</sub> standards for the last three years.

#### **Particulate Matter**

The State 24-hour concentration standards for PM<sub>10</sub> have been exceeded between one and two days each year over the past three years at the San Bernardino Station. Over the past three years the Federal 24-hour standard for PM<sub>10</sub> has only been exceeded for one day in 2013 and one day in 2014 at the San Bernardino Station.

The Federal 24 hour standard for PM<sub>2.5</sub> was exceeded one day in 2013 and one day in 2014 over the past three years at the San Bernardino Station. There does not appear to be a noticeable trend for PM<sub>10</sub> or PM<sub>2.5</sub> in either maximum particulate concentrations or days of exceedances in the area. Particulate levels in the area are due to natural sources, grading operations, and motor vehicles.

According to the EPA, some people are much more sensitive than others to breathing fine particles (PM<sub>10</sub> and PM<sub>2.5</sub>). People with influenza, chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death due to breathing these fine particles. People with bronchitis can expect aggravated symptoms from breathing in fine particles. Children may experience decline in lung function due to breathing in PM<sub>10</sub> and PM<sub>2.5</sub>. Other groups considered sensitive are smokers and people who cannot breathe well through their noses. Exercising athletes are also considered sensitive, because many breathe through their mouths during exercise.

**Table 3**

**State and Federal Criteria Pollutant Standards**

| Air Pollutant                                     | Concentration / Averaging Time  |   | Most Relevant Effects  |
|---|---|---|--|
|   | California Standards  | Federal Primary Standards                                     |  |
| Ozone (O <sub>3</sub> )                           | 0.09 ppm/1-hour<br>0.07 ppm/8-hour  | 0.075 ppm/8-hour  | (a) Pulmonary function decrements and localized lung edema in humans and animals; (b) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (c) Increased mortality risk; (d) Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (e) Vegetation damage; (f) Property damage. |
| Carbon Monoxide (CO)                              | 20.0 ppm/1-hour<br>9.0 ppm/8-hour   | 35.0 ppm/1-hour<br>9.0 ppm/8-hour                             | (a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) Impairment of central nervous system functions; (d) Possible increased risk to fetuses.   |
| Nitrogen Dioxide (NO <sub>2</sub> )               | 0.18 ppm/1-hour<br>0.03 ppm/annual  | 0.053 ppm/annual  | (a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; (c) Contribution to atmospheric discoloration.  |
| Sulfur Dioxide (SO <sub>2</sub> )                 | 0.25 ppm/1-hour<br>0.04 ppm/24-hour   | 75 ppb/1-hour<br>0.14 ppm/24-hour                             | (a) Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma.  |
| Suspended Particulate Matter (PM <sub>10</sub> )  | 50 µg/m <sup>3</sup> /24-hour<br>20 µg/m <sup>3</sup> /annual   | 150 µg/m <sup>3</sup> /24-hour                                | (a) Exacerbation of symptoms in sensitive patients with respiratory or cardiovascular disease; (b) Declines in pulmonary function growth in children; (c) Increased risk of premature death from heart or lung diseases in elderly.  |
| Suspended Particulate Matter (PM <sub>2.5</sub> ) | 12 µg/m <sup>3</sup> / annual   | 35 µg/m <sup>3</sup> /24-hour<br>12 µg/m <sup>3</sup> /annual |  |
| Sulfates  | 25 µg/m <sup>3</sup> /24-hour   | No Federal Standards  | (a) Decrease in ventilatory function; (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease; (d) Vegetation damage; (e) Degradation of visibility; (f) property damage.   |
| Lead  | 1.5 µg/m <sup>3</sup> /30-day   | 1.5 µg/m <sup>3</sup> / calendar quarter                      | (a) Learning disabilities; (b) Impairment of blood formation and nerve conduction.   |
| Visibility Reducing Particles                     | Extinction coefficient of 0.23 per kilometer-visibility of 10 miles or more due to particles when humidity is less than 70 percent. | No Federal Standards  | Visibility impairment on days when relative humidity is less than 70 percent.  |

<sup>1</sup> Obtained from Draft 2012 AQMP, SCAQMD, 2012. EPA often only declares Nonattainment areas; everywhere else is listed as Unclassified/Attainment or Unclassifiable.

<sup>2</sup> A design value below the NAAQS for data through the full year or smog season prior to the attainment date is typically required for attainment demonstration.

<sup>3</sup> Obtained from <http://www.arb.ca.gov/desig/adm/adm.htm>.

<sup>4</sup> 1-hour O<sub>3</sub> standard (0.13 ppm) was revoked, effective June 15, 2005; however, the Basin has not attained this standard based on 2008-2010 data has some continuing obligations under the former standard.

<sup>5</sup> 1997 8-hour O<sub>3</sub> standard (0.08 ppm) was reduced (0.075 ppm), effective May 27, 2008; the 1997 O<sub>3</sub> standard and most related implementation rules remain in place until the 1997 standard is revoked by U.S. EPA.

<sup>6</sup> New NO<sub>2</sub> 1-hour standard, effective August 2, 2010; attainment designations January 20, 2012; annual NO<sub>2</sub> standard retained.

<sup>7</sup> The 1971 annual and 24-hour SO<sub>2</sub> standards were revoked, effective August 23, 2010; however, these 1971 standards will remain in effect until one year after U.S. EPA promulgates area designations for the 2010 SO<sub>2</sub> 1-hour standard. Area designations expected in 2012, with SSAB designated Unclassifiable/Attainment.

<sup>8</sup> Annual PM10 standard was revoked, effective December 18, 2006; redesignation request to Attainment of the 24-hour PM10 standard is pending with U.S. EPA

<sup>9</sup> Partial Nonattainment designation - Los Angeles County portion of Basin only.

<sup>2</sup> CAAQS = California Ambient Air Quality Standard; NAAQS = National Ambient Air Quality Standard; ppm = parts per million

## V. AIR QUALITY STANDARDS

---

### A. Regional Air Quality

Many air quality impacts that derive from dispersed mobile sources, which are the dominate pollution generators in the basin, often occurs hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants such as ozone. The incremental regional air quality impact of an individual project is generally very small and difficult to measure. Therefore, the SCAQMD has developed significance thresholds based on the volume of pollution emitted rather than on actual ambient air quality because the direct air quality impact of a project is not quantifiable on a regional scale. The SCAQMD CEQA Handbook states that any project in the South Coast Air Basin with daily emissions that exceed any of the identified significance thresholds should be considered as having an individually and cumulatively significant air quality impact. For the purposes to this air quality impact analysis, a regional air quality impact would be considered significant if emissions exceed the SCAQMD significance thresholds identified in Table 6.

### B. Local Air Quality

Project-related construction air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. In order to assess local air quality impacts the SCAQMD has developed Localized Significant Thresholds (LSTs) to assess the project-related air emissions in the project vicinity. The SCAQMD has also provided Final Localized Significant Threshold Methodology (LST Methodology), June 2003, which details the methodology to analyze local air emission impacts. The Localized Significant Threshold Methodology found that the primary emissions of concern are NO<sub>2</sub>, CO, PM10, and PM2.5.

The significance thresholds for the local emissions of NO<sub>2</sub> and CO are determined by subtracting the highest background concentration from the last three years of these pollutants from Table 5 above, from the most restrictive ambient air quality standards for these pollutants that are outlined in the Localized Significant Thresholds. Table 6 shows the Localized Significant Thresholds for NO<sub>2</sub>, CO, and PM10 and PM2.5 as well as the ambient significance concentrations.

### C. Toxic Air Contaminants

According to the SCAQMD CEQA Handbook, any project that has the potential to expose the public to toxic air contaminants in excess of the following thresholds would be considered to have a significant air quality impact:

- If the Maximum Incremental Cancer Risk is 10 in one million or greater; or
- Toxic air contaminants from the proposed project would result in a Hazard Index increase of 1 or greater.

In order to determine if the proposed project may have a significant impact related to hazardous air pollutants (HAP), the Health Risk Assessment Guidance for analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, (Diesel Analysis), prepared by SCAQMD, August 2003, recommends that if the proposed project is anticipated to create hazardous air pollutants through stationary sources or regular operations of diesel trucks on the project site, then the proximity of the nearest receptors to the source of the hazardous air pollutants and the toxicity of the hazardous air pollutants should be analyzed through a comprehensive facility-wide health risk assessment (HRA).

**D. Odor Impacts**

The SCAQMD CEQA Handbook states that an odor impact would occur if the proposed project creates an odor nuisance pursuant to SCAQMD Rule 402, which states:

“A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

The provisions of this rule shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.”

If the proposed project results in a violation of Rule 402 with regards to odor impacts, then the proposed project would create a significant odor impact.

**E. Greenhouse Gases**

1. Regional - South Coast Air Quality Management District

The project is within the South Coast Air Basin, which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD).

**SCAQMD Regulation XXVII, Climate Change.** SCAQMD Regulation XXVII currently includes three rules:

- The purpose of Rule 2700 is to define terms and post global warming potentials.
- The purpose of Rule 2701, SoCal Climate Solutions Exchange, is to establish a voluntary program to encourage, quantify, and certify voluntary, high quality certified greenhouse gas emission reductions in the SCAQMD.
- Rule 2702, Greenhouse Gas Reduction Program, was adopted on February 6, 2009. The purpose of this rule is to create a Greenhouse Gas Reduction Program for greenhouse gas emission reductions in the SCAQMD. The SCAQMD will fund projects through contracts in response to requests for proposals or purchase reductions from other parties.

A variety of agencies have developed greenhouse gas emission thresholds and/or have made recommendations for how to identify a threshold. However, the

thresholds for projects in the jurisdiction of the SCAQMD remain in flux. The California Air Pollution Control Officers Association explored a variety of threshold approaches, but did not recommend one approach (2008). The ARB recommended approaches for setting interim significance thresholds (California Air Resources Board 2008b), in which a draft industrial project threshold suggests that non-transportation related emissions under 7,000 MTCO<sub>2e</sub> per year would be less than significant; however, the ARB has not approved those thresholds and has not published anything since then. The Bay Area Air Quality Management District and the San Joaquin Valley Air Pollution Control District have both developed greenhouse gas thresholds. However, those thresholds are not applicable to the project since the project is under the jurisdiction of the SCAQMD. The SCAQMD is in the process of developing thresholds, as discussed below.

**SCAQMD Threshold Development.** On December 5, 2008, the SCAQMD Governing Board adopted an interim greenhouse gas significance threshold for stationary sources, rules, and plans where the SCAQMD is lead agency (SCAQMD permit threshold). The SCAQMD permit threshold consists of five tiers. However, the SCAQMD is not the lead agency for this project. Therefore, the five permit threshold tiers do not apply to the proposed project.

The SCAQMD is in the process of preparing recommended significance thresholds for greenhouse gases for local lead agency consideration (“SCAQMD draft local agency threshold”); however, the SCAQMD Board has not approved the thresholds as of the date of the Notice of Preparation. The current draft thresholds consist of the following tiered approach:

- Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA.
- Tier 2 consists of determining whether the project is consistent with a greenhouse gas reduction plan. If a project is consistent with a qualifying local greenhouse gas reduction plan, it does not have significant greenhouse gas emissions.
- Tier 3 consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project’s construction emissions are averaged over 30 years and are added to a project’s operational emissions. If a project’s emissions are under one of the following screening thresholds, then the project is less than significant:
  - All land use types: 3,000 MTCO<sub>2e</sub> per year
  - Based on land use type: residential: 3,500 MTCO<sub>2e</sub> per year; commercial: 1,400 MTCO<sub>2e</sub> per year; or mixed use: 3,000 MTCO<sub>2e</sub> per year.
  - Based on land type: Industrial (where SCAQMD is the lead agency), 10,000 MTCO<sub>2e</sub> per year.
- Tier 4 has the following options:
  - Option 1: Reduce emissions from business as usual (BAU) by a certain percentage; this percentage is currently undefined.
  - Option 2: Early implementation of applicable AB 32 Scoping Plan measures.

- Option 3, 2020 target for service populations (SP), which includes residents and employees: 4.8 MTCO<sub>2</sub>e/SP/year for projects and 6.6 MTCO<sub>2</sub>e/SP/year for plans;
- Option 3, 2035 target: 3.0 MTCO<sub>2</sub>e/SP/year for projects and 4.1 MTCO<sub>2</sub>e/SP/year for plans.
- Tier 5 involves mitigation offsets to achieve target significance threshold.

The SCAQMD's draft threshold uses the Executive Order S-3-05 goal as the basis for the Tier 3 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap carbon dioxide concentrations at 450 ppm, thus stabilizing global climate. Specifically, the Tier 3 screening level for stationary sources is based on an emission capture rate of 90 percent for all new or modified projects. A 90 percent emission capture rate means that 90 percent of total emissions from all new or modified stationary source projects would be subject to a CEQA analysis, including a negative declaration, a mitigated negative declaration, or an environmental impact report, which includes analyzing feasible alternatives and imposing feasible mitigation measures. A GHG significance threshold based on a 90 percent emission capture rate may be more appropriate to address the long-term adverse impacts associated with global climate change because most projects will be required to implement GHG reduction measures. Further, a 90 percent emission capture rate sets the emission threshold low enough to capture a substantial fraction of future stationary source projects that will be constructed to accommodate future statewide population and economic growth, while setting the emission threshold high enough to exclude small projects that will in aggregate contribute a relatively small fraction of the cumulative statewide GHG emissions. This assertion is based on the fact that staff estimates that these GHG emissions would account for slightly less than one percent of future 2050 statewide GHG emissions target (85 MMTCO<sub>2</sub>eq/yr). In addition, these small projects may be subject to future applicable GHG control regulations that would further reduce their overall future contribution to the statewide GHG inventory. Finally, these small sources are already subject to BACT for criteria pollutants and are more likely to be single-permit facilities, so they are more likely to have few opportunities readily available to reduce GHG emissions from other parts of their facility.

The SCAQMD has adopted a quantitative annual threshold of 10,000 MTCO<sub>2</sub>e for industrial uses. To be conservative, this project's emissions have been compared to both the draft screening threshold of 3,000 MTCO<sub>2</sub>e per year and the industrial threshold of 10,000 MTCO<sub>2</sub>e. Therefore, the SCAQMD's GHG emission thresholds are applicable to the proposed project and have been used as the threshold of significance.

## 2. Local - City of San Bernardino

The City of San Bernardino is a participating member of the San Bernardino Associated Governments (SANBAG) San Bernardino County Regional Greenhouse Gas Reduction Plan. The City of San Bernardino is one of the 21 Partnership Cities of San Bernardino County and the Partnership has committed to actions that will reduce GHG emissions associated with its regional (or Countywide) activities as a whole. The

21 Partnership cities participating in the SANBAG San Bernardino County Regional Greenhouse Gas Reduction Plan are Adelanto, Big Bear Lake, Chino, Chino Hills, Colton, Fontana, Grand Terrace, Hesperia, Highland, Loma Linda, Montclair, Needles, Ontario, Rancho Cucamonga, Redlands, Rialto, San Bernardino, Twentynine Palms, Victorville, Yucaipa, and Yucca Valley. By working in a collaborative manner on these goals, the cities aim to more effectively address emissions from activities that are affected or influenced by the region as a whole.

According to 3.18 City of San Bernardino Chapter, of the SANBAG San Bernardino County Regional Greenhouse Gas Reduction Plan (2014). The City of San Bernardino selected a goal to reduce its community GHG emissions to a level that is 15% below its 2008 GHG emissions level by 2020. The City will meet and exceed this goal subject to reduction measures that are technologically feasible and cost-effective per AB 32 through a combination of state (~86%) and local (~14%) efforts. The City actually exceeds the goal with only state/county level actions (104% of goal), but has committed to several additional local measures.

The City of San Bernardino's Sustainability Master Plan Task Force, appointed by the City Council, is recommending various draft strategies for the Mayor and Common Council to consider adopting. This framework of strategies is located within the Land Use and Transportation section of the Draft Sustainable Master Plan (SMP). If adopted, the Draft SMP will support the goals of SB 375 and the Sustainable Communities Strategy through a wide range of actions. The Draft SMP will include GHG reduction measures similar to, but different from, the measures listed in the Plan. The Draft SMP measures will generally be more specific to the City of San Bernardino, but they will also support the goals of AB 32. The SMP follows the organization of the SANBAG San Bernardino County GHG Reduction Plan, with the SMP measures following the SANBAG San Bernardino County GHG Reduction Plan measures. For consistency with the County-level plan, estimates of GHG emission reductions identified in the SMP were obtained using the regional quantification tool.

The Pavley vehicle standards, the state's low carbon fuel standard, the RPS, and other state measures will reduce GHG emissions in San Bernardino's on-road, solid waste, and building energy sectors in 2020. An additional reduction of 72,138 MTCO<sub>2</sub>e will be achieved primarily through the following local measures, in order of importance: GHG Performance Standard for New Development; Energy Efficiency for Existing Buildings; and Implementation of the Sustainable Communities Strategy. San Bernardino's Plan has the greatest impacts on GHG emissions in the solid waste management, on-road transportation, and building energy sectors.

**Threshold for this project.** If the project's emissions exceed the SCAQMD's and GHG Reduction Plan's screening threshold of 3,000 MTCO<sub>2</sub>e per year for all land use projects, then the project's year 2020 emissions will be compared to the project's baseline GHG emissions.

**Table 6**

**SCAQMD Air Quality Significance Thresholds<sup>1</sup>**

| Mass Daily Thresholds                                 |  |                     |
|---|--|---------------------|
| Pollutant   | Construction (lbs/day)   | Operation (lbs/day) |
| NOx   | 100  | 55                  |
| VOC   | 75   | 55                  |
| PM10  | 150  | 150                 |

## **VI. SHORT-TERM CONSTRUCTION-RELATED AIR QUALITY IMPACTS**

Construction activities associated with the proposed project would have the potential to generate air emissions, toxic air contaminant emissions, and odor impacts. Assumptions for the phasing, duration, and required equipment for the construction of the proposed project were obtained from the project applicant. The construction activities for the proposed project are anticipated to include: site demolition of approximately 16,332 square feet, grading of 25.25 acres, construction of 564,652 square feet of building space and 103,585 square feet of landscaping, paving of 5.84 acres of on-site roads and a 452-space parking lot, and application of architectural coatings. The project will be constructed in one phase. The construction of the project is expected to begin June 2016 and be completed in March 2017. The project will be operational in 2017.

### **A. Construction-Related Regional Impacts**

The construction-related regional air quality impacts have been analyzed for both criteria pollutants and GHGs.

#### **1. Construction-Related Criteria Pollutants Analysis**

The following provides a discussion of the methodology used to calculate regional construction air emissions and an analysis of the proposed project's short-term construction emissions for the criteria pollutants.

##### *Methodology*

Typical emission rates from construction activities were obtained from CalEEMod Version 2013.2.2. CalEEMod is a computer model published by the SCAQMD for estimating air pollutant emissions. The CalEEMod program uses the EMFAC2011 computer program to calculate the emission rates specific for the western portion of San Bernardino County for construction-related employee vehicle trips and the OFFROAD2011 computer program to calculate emission rates for heavy truck operations. EMFAC2011 and OFFROAD2011 are computer programs generated by CARB that calculates composite emission rates for vehicles. Emission rates are reported by the program in grams per trip and grams per mile or grams per running hour. Using CalEEMod, the peak daily air pollutant emissions during each phase was calculated and presented below. These emissions represent the highest level of emissions for each of the construction phases in terms of air pollutant emissions. The construction emissions printouts from CalEEMod are provided in Appendix B.

The Project will be required to comply with existing SCAQMD rules for the reduction of fugitive dust emissions. SCAQMD Rule 403 establishes these procedures. Compliance with this rule is achieved through application of standard best management practices in construction and operation activities, such as application of water or chemical stabilizers to disturbed soils, managing haul road dust by application of water, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 mph, sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph and establishing a permanent, stabilizing ground cover on finished sites. In addition, projects that disturb 50 acres or more of soil or move 5,000

cubic yards of materials per day are required to submit a Fugitive Dust Control Plan or a Large Operation Notification Form to SCAQMD. Based on the size of the Project area (approximately 25.25 acres) a Fugitive Dust Control Plan or Large Operation Notification would not be required.

SCAQMD's Rule 403 minimum requirements require that the application of the best available dust control measures are used for all grading operations and include the application of water or other soil stabilizers in sufficient quantity to prevent the generation of visible dust plumes. Compliance with Rule 403 would require the use of water trucks during all phases where earth moving operations would occur. Compliance with Rule 403 is required.

The phases of the construction activities which have been analyzed below are: 1) grading, 2) building construction, 3) paving, and 4) application of architectural coatings. For details on construction modeling, please see Appendix B.

The application of architectural coatings would occur after the completion of the construction phase. Per SCAQMD Rule 1113 as amended on June 3, 2011, the architectural coatings applied after January 1, 2014 will be limited to an average of 50 grams per liter or less and the CalEEMod model default VOC emissions have been adjusted accordingly. The architectural coating phase was modeled based on the CalEEMod-based calculation of the exterior area of 308,227 square feet and 846,978 square feet<sup>2</sup> for the interior. The exterior amount also includes 25,901 square feet of painting for the parking lot (approximately 6 percent of the paved area). According to the site plan, the concrete tilt-up panels will be pre-coated. Therefore, the emissions modeled by CalEEMod are likely an over-estimation VOC emissions.

#### *Project Impacts*

The construction-related criteria pollutant emissions for each phase are shown below in Table 7. Table 7 shows that none of the analyzed criteria pollutants would exceed the regional emissions thresholds. Therefore, a less than significant regional air quality impact would occur from construction of the proposed project.

### **B. Construction-Related Local Impacts**

Construction-related air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. The proposed project has been analyzed for the potential local air quality impacts created from: construction-related fugitive dust and diesel emissions; from toxic air contaminants; and from construction-related odor impacts.

---

<sup>2</sup> Interior area to be painted (SF) = (building square footage x 2) x 0.75  
Exterior to be painted (SF) = (building square footage x 2) x 0.25

1. Local Air Quality Impacts from Construction

The SCAQMD has published a “Fact Sheet for Applying CalEEMod to Localized Significance Thresholds” (South Coast Air Quality Management District 2011b). CalEEMod calculates construction emissions based on the number of equipment hours and the maximum daily disturbance activity possible for each piece of equipment. In order to compare CalEEMod reported emissions against the localized significance threshold lookup tables, the CEQA document should contain in its project design features or its mitigation measures the following parameters:

- 1) The off-road equipment list (including type of equipment, horsepower, and hours of operation) assumed for the day of construction activity with maximum emissions.
- 2) The maximum number of acres disturbed on the peak day.
- 3) Any emission control devices added onto off-road equipment.
- 4) Specific dust suppression techniques used on the day of construction activity with maximum emissions.

The CalEEMod output sheets included in Appendix B show the equipment used for this analysis.

As shown in Table 8, the maximum number of acres disturbed in a day would be five acres during grading.

The local air quality emissions from construction were analyzed using the SCAQMD’s Mass Rate Localized Significant Threshold Look-up Tables and the methodology described in Localized Significance Threshold Methodology, prepared by SCAQMD, revised July 2008. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily emissions of CO, NOx, PM10, and PM2.5 from the proposed project could result in a significant impact to the local air quality. The emission thresholds were calculated based on the Central San Bernardino Valley source receptor area (SRA 34) and a disturbance of five acres per day at the closest distance, 25 meters (82 feet), as the distance to the nearest sensitive receptors to the north of the site boundary is less than 25 meters. Table 9 shows the on-site emissions from the CalEEMod model for the different construction phases and the calculated emissions thresholds.

The data provided in Table 9 shows that none of the analyzed criteria pollutants would exceed the calculated local emissions thresholds at the nearest sensitive receptors. Therefore, a less than significant local air quality impact would occur from construction of the proposed project.

2. Construction-Related Toxic Air Contaminant Impacts

The greatest potential for toxic air contaminant emissions would be related to diesel particulate emissions associated with heavy equipment operations during construction of the proposed project. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of “individual cancer risk”.

“Individual Cancer Risk” is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. Given the relatively limited number of heavy-duty construction equipment and the short-term construction schedule, the proposed project would not result in a long-term (i.e., 70 years) substantial source of toxic air contaminant emissions and corresponding individual cancer risk. Therefore, no significant short-term toxic air contaminant impacts would occur during construction of the proposed project.

3. Construction-Related Odor Impacts

Potential sources that may emit odors during construction activities include the application of materials such as asphalt pavement. The objectionable odors that may be produced during the construction process are of short-term in nature and the odor emissions are expected cease upon the drying or hardening of the odor producing materials. Due to the short-term nature and limited amounts of odor producing materials being utilized, no significant impact related to odors would occur during construction of the proposed project.

**Table 7**

**Construction-Related Regional Pollutant Emissions<sup>1</sup>**

| Activity                                       | Pollutant Emissions (pounds/day) |              |              |                 |              |             |
|--|----------------------------------|--------------|--------------|-----------------|--------------|-------------|
|  | VOC                              | NOx          | CO           | SO <sub>2</sub> | PM10         | PM2.5       |
| <b>Demolition</b>                              |                                  |              |              |                 |              |             |

<sup>1</sup> Source: Calculated from CalEEMod and SCAQMD's Mass Rate Look-up Tables for five acres in SRA 34 Central San Bernardino Valley.

<sup>2</sup> The estimated distance from the proposed grading activities to the nearest sensitive receptor (residences to the north of the project site) is less than 25 meters or 82 feet.

## VII. LONG-TERM OPERATIONAL AIR QUALITY IMPACTS

---

The on-going operation of the proposed project would result in a long-term increase in air quality emissions. This increase would be due to emissions from the project-generated vehicle trips and through operational emissions from the on-going use of the proposed project. The following section provides an analysis of potential long-term air quality impacts due to: regional air quality and local air quality impacts with the on-going operations of the proposed project.

### A. Operations-Related Regional Air Quality Impacts

The potential operations-related air emissions have been analyzed below for the criteria pollutants and cumulative impacts.

#### 1. Operations-Related Criteria Pollutant Analysis

The operations-related criteria air quality impacts created by the proposed project have been analyzed through use of the CalEEMod model. The operating emissions were based on the year 2017, which is the anticipated opening year for the proposed project. The operations daily emissions printouts from the CalEEMod model are provided in Appendix B. The CalEEMod analyzes operational emissions from area sources, energy usage, and mobile sources, which are discussed below.

#### **Mobiles Sources**

Mobile sources include emissions from the vehicle miles generated from the proposed project. The vehicle trips associated with the proposed project have been analyzed by inputting the project-generated vehicular trips from the Waterman Industrial Center Traffic Impact Analysis (TIA) (prepared by Kunzman Associates, Inc. March 2016), into the CalEEMod Model. The Trip Generation Analysis found that the proposed project would create 587 automobile round trips, 61 2-axle truck round trips, 82 3-axle truck round trips, and 218 4+-axle truck round trips per day. The trip generation rate is 1.68 per thousand square feet. The program then applies the emission factors for each trip which is provided by the EMFAC2011 model to determine the vehicular traffic pollutant emissions. The vehicle mix was changed in CalEEMod to match the TIA (see Table 10). Due to the proposed project's location and proposed unrefrigerated warehouse land use, the average customer based trip length was increased to 40 miles for C-W, while all other trip lengths were based on the urban default values. The trip percentages were also revised to match the TIA; 38.1 percent for C-W (trucks) and 61.9 C-NW (cars).

#### **Area Sources**

Area sources include emissions from consumer products, landscape equipment and architectural coatings. The area source emissions were based on the on-going use of the proposed 564,652 square feet of warehouse in the CalEEMod model. In order to account for SCAQMD Rule 1113, VOC content of paints was changed to 50g/L No other changes were made to the default area source parameters.

### **Energy Usage**

Energy usage includes emissions from the generation of electricity and natural gas used on-site. The energy usage emissions were based on the on-going use of the proposed 564,652 square feet of warehouse in the CalEEMod model. No changes were made to the default energy usage parameters. It should be noted that 2013 Title 24 commercial standards are 30 percent more efficient than 2008 Title 24 Standards (used as the baseline for emissions calculations in CalEEMod).

### *Project Impacts*

The worst-case summer or winter VOC, NO<sub>x</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions created from the proposed project's long-term operations have been calculated and are summarized below in Table 11. The data provided in Table 11 shows that for the on-going operations activities for the proposed project, NO<sub>x</sub> emissions would exceed the SCAQMD regional thresholds of significance discussed above in Section V. Therefore, operation of the proposed project would potentially create a significant regional impact from NO<sub>x</sub> emissions and mitigation is required.

Mitigation Measures 1 through 7 are provided to reduce the operational emissions (see Section XI. Mitigation Measures for details on the measures). Table 12 shows that with incorporation of the aforementioned mitigation measures, operational regional criteria pollutant emissions would no longer exceed regional operational thresholds for NO<sub>x</sub>. Therefore, with mitigation, a less than significant regional air quality impact would occur from operation of the proposed project.

## 2. Cumulative Regional Air Quality Impacts

Cumulative projects include local development as well as general growth within the project area. However, as with most development, the greatest source of emissions is from mobile sources, which travel well out of the local area. Therefore, from an air quality standpoint, the cumulative analysis would extend beyond any local projects and when wind patterns are considered, would cover an even larger area. Accordingly, the cumulative analysis for the project's air quality must be generic by nature.

The project area is out of attainment for both ozone and PM<sub>10</sub> particulate matter. The project area is out of attainment for both ozone and PM<sub>10</sub> particulate matter. Construction and operation of cumulative projects will further degrade the local air quality, as well as the air quality of the South Coast Air Basin. The greatest cumulative impact on the quality of regional air cell will be the incremental addition of pollutants mainly from increased traffic from residential, commercial, and industrial development and the use of heavy equipment and trucks associated with the construction of these projects. Air quality will be temporarily degraded during construction activities that occur separately or simultaneously. However, in accordance with the SCAQMD methodology, projects that do not exceed the SCAQMD criteria or can be mitigated to less than criteria levels are not significant and do not add to the overall cumulative impact. With respect to long-term emissions, this project would create a less than significant cumulative impact.

## **B. Operations-Related Local Air Quality Impacts**

Project-related air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. The proposed project has been analyzed for the potential local CO emission impacts from the project-generated vehicular trips and from the potential local air quality impacts from on-site operations. The following analysis analyzes the vehicular CO emissions, local impacts from on-site operations, and odor impacts.

### **1. Local CO Emission Impacts from Project-Generated Vehicular Trips**

CO is the pollutant of major concern along roadways because the most notable source of CO is motor vehicles. For this reason, CO concentrations are usually indicative of the local air quality generated by a roadway network and are used as an indicator of potential local air quality impacts. Local air quality impacts can be assessed by comparing future without and with project CO levels to the State and Federal CO standards which were presented in above in Section V.

To determine if the proposed project could cause emission levels in excess of the CO standards discussed above in Section V, a sensitivity analysis is typically conducted to determine the potential for CO “hot spots” at a number of intersections in the general project vicinity. Because of reduced speeds and vehicle queuing, “hot spots” typically occur at high traffic volume intersections with a Level of Service E or worse.

The Traffic Analysis showed that the project would only generate a maximum of 949 trips. The intersection with the highest traffic volume is located at E Street and Orange Show Road and has a peak hour volume of 1,816 trips for the Year 2035 With Project AM peak hour scenario. The 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan) showed that an intersection which has a daily traffic volume of approximately 100,000 vehicles per day would not violate the CO standard. Therefore, as the intersection with the highest traffic volume falls far short of 100,000 vehicles, no CO “hot spot” modeling was performed and no significant long-term air quality impact is anticipated to local air quality with the on-going use of the proposed project.

### **2. Local Air Quality Impacts from On-Site Operations**

Project-related air emissions from on-site sources such as architectural coatings, landscaping equipment, on-site usage of natural gas appliances as well as the operation of vehicles on-site may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. The nearest sensitive receptors that may be impacted by the proposed project are the residential dwelling units to the north and west of the boundaries of the project site.

The local air quality emissions from on-site operations were analyzed according to the methodology described in Localized Significance Threshold Methodology, prepared by

SCAQMD, revised July 2008. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily emissions of CO, NOx, PM10, and PM2.5 from the proposed project could result in a significant impact to the local air quality. The proposed project was analyzed based on the Central San Bernardino Valley source receptor area and a five acre project site, which is the largest site available in the Look-up Tables and can be used as a screening analysis to determine whether more extension dispersion modeling is required. Table 13 shows the on-site emissions from the CalEEMod model that includes natural gas usage, landscape maintenance equipment, and vehicles operating on-site and the calculated emissions thresholds. The data provided in Table 13 shows that the on-going operations of the proposed project would not exceed the local NOx, CO, PM10 and PM2.5 thresholds of significance discussed above in Section V. Therefore, the on-going operations of the proposed project would create a less than significant operations-related impact to local air quality due to on-site emissions and no mitigation would be required.

3. Operations-Related Odor Impacts

Potential sources that may emit odors during the on-going operations of the proposed project would include odor emissions from diesel truck emissions and trash storage areas. Due to the distance of the nearest receptors from the project site and through compliance with SCAQMD's Rule 402 no significant impact related to odors would occur during the on-going operations of the proposed project.

<sup>4</sup> On-site vehicular emissions based on 1/10 of the gross vehicular emissions and road dust.

<sup>5</sup> The estimated distance from the proposed project to the nearest sensitive receptor (residences to the north of the project site) is less than 25 meters or 82 feet.

## VIII. DIESEL EMISSIONS HEALTH RISK ASSESSMENT

---

The on-going operation of the proposed project would generate toxic air contaminant emissions from diesel truck emissions created by the on-going operations of the proposed project. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology<sup>3</sup>.

A health risk assessment requires the completion and interaction of four general steps:

1. Quantify project-generated TAC emissions.
2. Identify nearby ground-level receptor locations that may be affected by the emissions (including any special sensitive receptor locations such as residences, schools, hospitals, convalescent homes, and daycare centers).
3. Perform air dispersion modeling analyses to estimate ambient pollutant concentrations at each receptor location using project TAC emissions and representative meteorological data to define the transport and dispersion of those emissions in the atmosphere.
4. Characterize and compare the calculated health risks with the applicable health risk significance thresholds.

### A. Emission Inventory Development

Important issues that affect the dispersion modeling include the following: 1) Model Selection, 2) Source Treatment, 3) Meteorological Data, and 4) Receptor Grid. Each of these issues is addressed below.

#### 1. Emission Source Estimates - DPM from Motor Vehicles

DPM emissions from the various sources were calculated using information derived from the project description, and mobile source emission factors from the CARB EMFAC2011 emissions factor model<sup>4</sup>. Truck mix information was obtained from the project-specific traffic report (Kunzman 2015).

Four pieces of information are required to generate the mobile source emissions from the proposed project:

---

<sup>3</sup> In February 2015, the Office of Environmental Health Hazard Assessment updated their "Air Toxics Hot Spots Program, Risk Assessments Guidelines, Guidance Manual for Preparation of Health Risk Assessments; however, the updated OEHHHA guidance states in the page footers "do not cite or quote." SCAQMD staff are still in the process of incorporating the updates into their methodology for SCAQMD's Rules 1401, 1401.1, 1402, and 212, and currently updating their HRA Guidance for permitting and CEQA analyses; therefore, the existing SCAQMD guidance was used to assess HRA impacts in this analysis. Per SCAQMD staff (personal communication with Dr. Jillian Wong 6-19-2015), updated SCAQMD HRA guidance will be forthcoming and use of current methodology and EMFAC2011 is acceptable.

<sup>4</sup> An emission factor is a representative value that attempts to relate the quantity of a pollutant released to the atmosphere with an activity associated with the release of that pollutant. These factors are usually expressed as the weight of pollutant divided by a unit of activity, volume, distance, or duration of the activity emitting the pollutant (e.g., grams of pollutant emitted per vehicle-mile traveled or grams of pollutant emitted per brake-horsepower).

- Number of vehicle trips for each component of the proposed project;
- Types of vehicles that access the proposed project (passenger car vs. heavy-duty truck and gasoline vs. diesel);
- The allocation of the vehicle trips to each building that comprises the proposed project; and
- Estimate of the vehicle emission factors for estimating exhaust and idling emissions.

#### *Estimate of Vehicle Trips and Vehicle Types*

The Kunzman Associates, Inc. project-specific traffic study (2016) showed the project is expected to generate approximately 949 vehicle trips per day.

The vehicle mix followed the recommendations of the SCAQMD warehouse study with a mix of 61.9 percent cars, 6.45 percent 2-axle trucks, 8.65 percent 3-axle trucks and 23.00 percent 4-axle trucks.

#### *Estimate of Emission Factors*

The DPM emission factors for the various vehicle types were derived from the CARB EMFAC2011 mobile source emission model. The 70-year average factors were derived for San Bernardino County for year 2017, the buildout year the proposed project. Emissions factors were estimated to establish the emissions generated while the vehicles travel off-site, along travel links from the entrance to the loading docks, and while idling at the loading dock during loading or unloading materials. All vehicles were assumed to travel on-site at a speed of 10 miles per hour. Off-site, the speeds along the roads were anticipated to average 35 miles per hour. Delivery vehicles were assumed to idle for a maximum of 15 minutes per vehicle per day (5 minutes per location: at the facility entrance, at the loading bay, and at the facility exit, in keeping with the CARB Air Toxic Control Measure (ATCM), which regulates truck idling time (CARB 2005). Table 14 provides the emission factors used in this assessment. It should be noted that the DPM emissions on both the gram per mile and gram per idle hour bases decline beyond 2015 for all vehicle classes and in particular the heavy-heavy-duty truck class (the 4+ axle “big rig” trucks). This is due to the CARB emissions’ requirements on heavy-duty trucks that call for either the replacement of older trucks with cleaner trucks or the installation of diesel particulate matter filters on the truck fleet.

#### *Emission Source Characterization*

Each of the emission source types described above also requires geometrical and emission release specifications for use in the air dispersion model. Table 15 provides a summary of the assumptions used to configure the various emission sources. The following definitions are used to characterize the emission source geometrical configurations referred to in Table 15:

Point source: A single, identifiable, local source of emissions; it is approximated in the AERMOD air dispersion model as a mathematical point in the modeling region with a location and emission characteristics (such as height of release, temperature, etc.), for example, a truck idle location.

Line source: A series of volume sources along a path, for example, vehicular traffic along a roadway.

Figure 3 provides the location of the project buildings, emission source locations, and the locations of the adjacent sensitive receptors (located near the site's northern boundary [approximately 65 feet from the site] and to the west of the project (approximately 170 feet from the project's western boundary)). Commercial receptors are labeled com\_9, golf\_13, and golf\_14 and are located just north of the site and at the San Bernardino Public Golf Course to the south of the project site (adjacent to the project's southern boundary) respectively. The patrons of the Golf Course are treated like commercial receptors due to their relatively short time at the location (not 24-hours). Residential receptors are shown as orange triangles labeled 1 through 8, 10 through 12, 15 and 16.

## **B. Receptor Network**

The assessment requires that a network of receptors be specified where the impacts can be computed at the various locations surrounding the project. Receptors were located at existing sensitive receptors surrounding the proposed project (as detailed above). In addition, the identified sensitive receptors locations were supplemented by the specification of a modeling grid that extended around the proposed project to identify other potential locations of impact. The locations of the receptors are shown as orange triangles on Figure 3.

## **C. Dispersion Modeling**

The next step in the assessment process utilizes the emissions inventory along with a mathematical air dispersion model and representative meteorological data to calculate impacts at the various receptor locations. The dispersion model used in this assessment is described below.

### **1. Model Selection**

The assessment of air quality and health risk impacts from pollutant emissions from this project applied the USEPA AERMOD Model, which is the air dispersion model accepted by the SCAQMD for performing air quality impact analyses. AERMOD predicts pollutant concentrations from point, area, volume, line, and flare sources with variable emissions in terrain from flat to complex with the inclusion of building downwash effects from buildings on pollutant dispersion. It captures the essential atmospheric physical processes and provides reasonable estimates over a wide range of meteorological conditions and modeling scenarios.

#### **oGeneral Model Assumptions**

### **2. General Model Assumptions**

A summary of Emission Configurations is shown in Table 15. The basic options used in the dispersion modeling are summarized in Table 16.

As indicated in Table 16, the analysis takes into account the effects of building downwash on the dispersion of emissions from the various sources located on the

project's property. Building downwash occurs when the aerodynamic turbulence, induced by nearby buildings, causes pollutants emitted from an elevated source to be mixed rapidly toward the ground (downwash), resulting in potentially higher ground-level concentrations than if the buildings were not present. The AERMOD dispersion model contains algorithms to account for building downwash effects. The required information includes the location of the emission source; the location of adjacent buildings; and the building geometry in terms of length, width, and height. For purposes of this analysis, the emission source and building locations were taken from the project site plan. The building geometries were derived from the project plan, assuming a building height of 43 feet (as stated on the site plan) for the building.

### 3. Meteorological Data

Meteorological data from the Air District's San Bernardino monitoring site was selected for this modeling application. Five full years of sequential meteorological data was collected at the site from January 1, 2007 to December 31, 2011 by the SCAQMD. The SCAQMD processed the data for input to the model. The data was obtained at SCAQMD's <http://www.aqmd.gov/smog/metdata/AERMOD.html> (see Figure 4).

## D. Estimation of Health Risks

Health risks from diesel particulate matter are twofold. First, diesel particulate matter is a carcinogen according to the State of California. Second, long-term chronic exposure to diesel particulate matter can cause health effects to the respiratory system. Each of these health risks is discussed below.

### 1. Cancer Risks

According to the in Health Risk Assessment for Proposed Land Use Projects, prepared by CAPCOA, July 2009 and the SCAQMD Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality, the cancer risk should be calculated using the following formula:

$$[\text{Dose-inh (mg)/(Kg-day)}] * [\text{Oral Slope Factor (kg-day)/mg}] * [1 \times 10^6] = \text{Potential Cancer Risk}$$

Where:

Oral Slope Factor = 1.1

$$\text{Dose-inh} = (\text{C-air} * \text{DBR} * \text{A} * \text{EF} * \text{ED} * 10^{-6}) / \text{AT}$$

Where:

C<sub>air</sub> [Concentration in air (µg/m<sup>3</sup>)] = (Calculated by AERMOD Model)

DBR [Daily breathing rate (L/kg body weight – day)] = 302 for residential, 149 for off-site worker, and 581 for children

A [Inhalation absorption factor] = 1

EF [Exposure frequency (days/year)] = 350

ED [Exposure duration (years)] = 70 for residential, 40 for worker, and 9 for school child

$10^6$  [Micrograms to milligrams conversion]

AT [Average time period over which exposure is averaged in days] = 25,550

The Year 2017 model run results are shown below on Figure 5 and Appendix C. Table 17 provides a summary of the calculated diesel emission concentrations at the nearest sensitive receptors for the residential exposure scenario and Table 18 shows the Worker exposure scenario. There are no schools in the project vicinity. Table 17 shows that the highest residential cancer risks at any receptor location does not exceed a cancer risk increase of 6.52 per million people. As shown in Table 18, the highest risk to off-site workers does not exceed a cancer risk increase of 0.65 per million people. As shown on Figure 5, all off-site diesel emissions concentrations were found to be below the 10.0 in a million cancer risk threshold that has been discussed above in Section 2.0. Therefore, no significant long-term health impacts would occur to adjacent receptors from the operation of diesel trucks on the project site.

## 2. Non-Cancer Risks

The relationship for non-cancer health effects is given by the equation:

$$\text{HIDPM} = \text{CDPM}/\text{RELDPM}$$

Where,

- HIDPM = Hazard Index; an expression of the potential for non-cancer health effects.
- CDPM = Annual average diesel particulate matter concentration in  $\mu\text{g}/\text{m}^3$ .
- RELDPM = Reference Exposure Level (REL) for diesel particulate matter; the diesel particulate matter concentration at which no adverse health effects are anticipated.

The non-carcinogenic hazards to residential and worker receptors are also detailed in Tables 17 and 18 respectively. The RELDPM is  $5 \mu\text{g}/\text{m}^3$ . The Office of Environmental Health Hazard Assessment as protective for the respiratory system has established this concentration. Using the maximum DPM concentration, the resulting Hazard Index is

$$\text{HIDPM} = 0.03042/5 = 0.0061$$

The criterion for significance is a Hazard Index increase of 1.0 or greater. Therefore, the on-going operations of the proposed project would result in a less than significant impact due to the non-cancer risk from diesel emissions created by the proposed project.

**Table 14**

**2017 DPM Emissions Factors for the Proposed Project (70-year average)<sup>1</sup>**

| Vehicle Class            | Idling (g/hr) | On-Site Travel (g/mi) | Off-Site Travel (g/mi) |

## **IX. GLOBAL CLIMATE CHANGE ANALYSIS**

---

The proposed project is anticipated to generate GHG emissions from area sources, energy usage, mobile sources, waste, water, and construction equipment. The following provides the methodology used to calculate the project-related GHG emissions, the project impacts and a consistency analysis of the proposed project with any applicable GHG reduction plans, policies or regulations.

### **A. Methodology**

The CalEEMod Version 2013.2.2 was used to calculate the GHG emissions from the proposed project. Through San Bernardino Associated Governments (SANBAG), the City of San Bernardino forms the San Bernardino Chapter of the San Bernardino County Regional GHG Reduction Plan. The Plan has been prepared to assist the City in conforming to the GHG emissions reductions as mandated under AB 32. Based on the CARB Scoping Plan, reducing GHG emissions to 1990 levels by 2020 means cutting approximately 30 percent from business-as-usual (BAU) emissions levels, or about 15 percent from year 2008 levels, which is the baseline year for the GHG Reduction Plan. Consistent with the CARB Scoping Plan, the City of San Bernardino has chosen a reduction target of 15 percent below 2008 GHG emissions levels by 2020. If the project exceeds the SCAQMD screening threshold of 3,000 MTCO<sub>2</sub>e per year for all land use types, then the project's year 2020 emissions will be compared to the project's baseline (BAU) GHG emissions.

The project's year 2017 (opening year) emissions were calculated, compared to the both the SCAQMD 3,000 MTCO<sub>2</sub>e per year screening threshold and the SCAQMD industrial threshold of 10,000 MTCO<sub>2</sub>e per year and the unmitigated results are shown in Table 19.

#### **1. Area Sources**

Area sources include emissions from consumer products, landscape equipment and architectural coatings. Emissions from architectural coating reflect SCAQMD Rule 1113.

#### **2. Energy Usage**

Energy usage includes emissions from the generation of electricity and natural gas used on-site. The energy usage was based on the CalEEMod defaults. No changes were made to the default energy usage parameters.

#### **3. Mobile Sources**

Mobile sources were analyzed in the manner described in Section VII above.

4. Waste

Waste includes the GHG emissions generated from the processing of waste from the proposed project as well as the GHG emissions from the waste once it is interred into a landfill. The CalEEMod default values were used in the analysis.

5. Water

Water includes the water used for the interior of the building as well as for landscaping and is based on the GHG emissions associated with the energy used to transport and filter the water. The CalEEMod default values were used in the analysis.

6. Construction

The construction-related GHG emissions were also included in the analysis and were based on a 30 year amortization rate as recommended in the SCAQMD GHG Working Group meeting on November 19, 2009. The construction-related GHG emissions were calculated by CalEEMod and detailed above in Section VI.

**B. Project Greenhouse Gas Emissions**

The GHG emissions have been calculated based on the parameters described above. A summary of the results are shown below in Table 19 and the CalEEMod Model run for the proposed project is provided in Appendix D. Table 19 shows that without any mitigation, the proposed project would generate 6,006.91 MTCO<sub>2</sub>e per year. However, with mitigation (as detailed in Section XI, Mitigation Measures), the results in Table 20 show that the project would generate 4,307.88 MTCO<sub>2</sub>e per year. According to the thresholds of significance established above in Section 5.0, a cumulative global climate change impact would potentially occur if the GHG emissions created from the on-going operations would exceed the 3,000 metric tons per year of CO<sub>2</sub>e SCAQMD and the SANBAG GHG Reduction Plan Screening threshold. The technical data, emission inventory processes, and methodology used in the San Bernardino County GHG Reduction Plan became the foundational inventory processes and methodology used in the SANBAG Regional GHG Reduction Plan. According to the County Reduction Plan, projects that exceed the screening thresholds would then need to have their base line (year 2010 in CalEEMod as year 2008 is not available) emissions compared to the project's year 2020 emissions to ascertain whether the project can meet the City of San Bernardino's reduction target of 15 percent below 2008 GHG emissions levels by 2020.

The project's baseline (year 2010) emissions (without design features, mitigation or regulation, per CARB protocol) are shown in Table 21 and the mitigated year 2020 emissions are shown in Table 22. As shown in Table 22, the project's year 2020 mitigated emissions will provide a 36.54 percent reduction from the project's year 2010 baseline emissions. Therefore, as the project's emissions meet the City's reduction threshold, the project's GHG emissions are considered to be less than significant.

Furthermore, the project's emissions were also compared the SCAQMD industrial project's threshold of 10,000 metric tons per year of CO<sub>2</sub>e and at 4,307.88 MTCO<sub>2</sub>e per year, do not exceed that industrial GHG threshold.

Therefore, with incorporation of mitigation, the operation of the proposed project would not create a significant cumulative impact to global climate change.

The project is also subject to the requirements of the California Green Building Standards Code. On January 12, 2010, the State Building Standards Commission unanimously adopted updates to the California Green Building Standards Code, which went into effect on January 1, 2011. The Code is a comprehensive and uniform regulatory code for all residential, commercial and school buildings.

The California Green Building Standards Code does not prevent a local jurisdiction from adopting a more stringent code as state law provides methods for local enhancements. The Code recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided they provide a minimum 50-percent diversion requirement. The code also provides exemptions for areas not served by construction and demolition recycling infrastructure. State building code provides the minimum standard that buildings need to meet in order to be certified for occupancy. Enforcement is generally through the local building official.

The California Green Building Standards Code (code section in parentheses) requires:

- Water Efficiency and Conservation [Indoor Water Use (4.303.1)]. Fixtures and fixture fittings reducing the overall use of potable water within the building by at least 20 percent shall be provided. The 20 percent reduction shall be demonstrated by one of the following methods:
  - Prescriptive Method: Showerheads ( $\leq 2.0$  gpm @ 80 psi); Residential Lavatory Faucets ( $\leq 1.5$  gpm @ 60 psi); Nonresidential Lavatory Faucets ( $\leq .4$  gpm @ 60 psi); Kitchen Faucets ( $\leq 1.8$  gpm @ 60 psi); Toilets ( $\leq 1.28$  gal/flush); and urinals ( $\leq 0.5$  gal/flush).
  - Performance Method: Provide a calculation demonstrating a 20% reduction of indoor potable water using the baseline values set forth in Table 4.303.1. The calculation will be limited to the total water usage of showerheads, lavatory faucets, water closets and urinals within the dwelling.
- Water Efficiency and Conservation [Outdoor Water Use (4.304.1)]. Irrigation Controllers. Automatic irrigation system controllers for landscaping provided by the builder and installed at the time of final inspection shall comply with the following:
  - Controllers shall be weather- or soil moisture-based controllers that automatically adjust irrigation in response to changes in plants' watering needs as weather or soil conditions change.
  - Weather-based controllers without integral rain sensors or communication systems that account for rainfall shall have a separate wired or wireless rain sensor which connects or communicates with the controller(s).
- Construction Waste Reduction of at least 50 percent (4.408.1). Recycle and/or salvage for reuse a minimum of 50 percent of the nonhazardous construction

and demolition waste in accordance with either Section 4.408.2, 4.408.3 or 4.408.4; OR meet a more stringent local construction and demolition waste management ordinance. Documentation is required per Section 4.408.5. Exceptions:

- Excavated soil and land-clearing debris.
- Alternate waste reduction methods developed by working with local enforcing agencies if diversion or recycle facilities capable of compliance with this item do not exist or are not located reasonably close to the jobsite.
- The enforcing agency may make exceptions to the requirements of this section when jobsites are located in areas beyond the haul boundaries of the diversion facility.
- Materials pollution control (4.504.1 – 4.504.6). Low-pollutant emitting interior finish materials such as paints, carpet, vinyl flooring and particleboard.
- Installer and Special Inspector Qualifications (702.1-702.2). Mandatory special installer inspector qualifications for installation and inspection of energy systems (e.g., heat furnace, air conditioner, mechanical equipment).

Compliance with 2013 Title 24 Standards and Green Building Standards (CalGreen) is included as mitigation and will reduce project-related greenhouse emissions.

### **C. Greenhouse Gas Plan Consistency**

The proposed project would have the potential to conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases. As stated previously, the City of San Bernardino is one of the 21 partnership cities that are participating in the San Bernardino Associated Governments (SANBAG) San Bernardino County Regional GHG Reduction Plan. Therefore, the applicable plan for the proposed project is the SANBAG San Bernardino County Regional GHG Reduction Plan. The City of San Bernardino forms the San Bernardino Chapter of the San Bernardino County Regional GHG Reduction Plan, released March 5, 2014. The Plan has been prepared to assist the City in conforming to the GHG emissions reductions as mandated under AB 32. Consistent with the CARB Scoping Plan, the City of San Bernardino has chosen a reduction target of 15 percent below 2008 GHG emissions levels by 2020.

The City of San Bernardino also has a Sustainability Master Plan. The City of San Bernardino's Sustainability Master Plan Task Force, appointed by the City Council, is recommending various draft strategies for the Mayor and Common Council to consider adopting. This framework of strategies is located within the Land Use and Transportation section of the Draft Sustainable Master Plan (SMP). If adopted, the Draft SMP will support the goals of SB 375 and the Sustainable Communities Strategy through a wide range of actions. The Draft SMP will include GHG reduction measures similar to, but different from, the measures listed in the GHG Plan. The Draft SMP measures will generally be more specific to the City of San Bernardino, but they will also support the goals of AB 32. The SMP follows the organization of the SANBAG San Bernardino County GHG Reduction Plan, with the SMP measures following the County GHG Reduction Plan measures.

As shown above (and in Table 22), the project's year 2020 mitigated emissions are 36.5 percent less than the project's baseline (year 2010) emissions; therefore, the project meet the reduction requirement of the City of San Bernardino Chapter of the SANBAG San Bernardino County Regional GHG Reduction Plan. Furthermore, the project will comply with applicable Green Building Standards and City of San Bernardino's policies regarding sustainability (as dictated by the City's General Plan), further analysis is not warranted. Impacts are considered to be less than significant.

## **X. AIR QUALITY COMPLIANCE**

---

The California Environmental Quality Act (CEQA) requires a discussion of any inconsistencies between a proposed project and applicable General Plans and Regional Plans (CEQA Guidelines Section 15125). The regional plan that applies to the proposed project includes the SCAQMD Air Quality Management Plan (AQMP). Therefore, this section discusses any potential inconsistencies of the proposed project with the AQMP.

The purpose of this discussion is to set forth the issues regarding consistency with the assumptions and objectives of the AQMP and discuss whether the proposed project would interfere with the region's ability to comply with Federal and State air quality standards. If the decision-makers determine that the proposed project is inconsistent, the lead agency may consider project modifications or inclusion of mitigation to eliminate the inconsistency.

The SCAQMD CEQA Handbook states that "New or amended General Plan Elements (including land use zoning and density amendments), Specific Plans, and significant projects must be analyzed for consistency with the AQMP". Strict consistency with all aspects of the plan is usually not required. A proposed project should be considered to be consistent with the AQMP if it furthers one or more policies and does not obstruct other policies. The SCAQMD CEQA Handbook identifies two key indicators of consistency:

- (1) Whether the project will result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.
- (2) Whether the project will exceed the assumptions in the AQMP in 2010 or increments based on the year of project buildout and phase.

Both of these criteria are evaluated in the following sections.

### **A. Criterion 1 - Increase in the Frequency or Severity of Violations**

Based on the air quality modeling analysis contained in this Air Analysis, short-term construction impacts will not result in significant impacts based on the SCAQMD regional and local thresholds of significance. This Air Analysis also found that with mitigation, long-term operations impacts will not result in significant impacts based on the SCAQMD local, regional, and toxic air contaminant thresholds of significance.

Therefore, the proposed project is not anticipated to contribute to the exceedance of any air pollutant concentration standards and is found to be consistent with the AQMP for the first criterion.

### **B. Criterion 2 - Exceed Assumptions in the AQMP?**

Consistency with the AQMP assumptions is determined by performing an analysis of the proposed project with the assumptions in the AQMP. The emphasis of this criterion is to insure that the analyses conducted for the proposed project are based on the same

forecasts as the AQMP. The Regional Comprehensive Plan and Guide (RCP&G) consists of three sections: Core Chapters, Ancillary Chapters, and Bridge Chapters. The Growth Management, Regional Mobility, Air Quality, Water Quality, and Hazardous Waste Management chapters constitute the Core Chapters of the document. These chapters currently respond directly to federal and state requirements placed on SCAG. Local governments are required to use these as the basis of their plans for purposes of consistency with applicable regional plans under CEQA. For this project, the City of San Bernardino General Plan defines the assumptions that are represented in the AQMP.

The City's General Plan land use designations for the project site are Industrial and Open Space. The City's zoning designation for the site includes: Industrial Light, Office Industrial Park, and Public Commercial Recreation. Therefore, the proposed project is not currently consistent with the land use or zoning designations. However, approval of the proposed project includes a General Plan Amendment (GPA) and a Zoning Map Amendment (ZMA) to change the General Plan land use designation to Industrial and the zoning designation to Industrial Light. With approval of the GPA and ZMA, the proposed project would be consistent with the land use and zoning designations and development standards for the project site.

With approval of the GPA and ZMA, the proposed project would be consistent with the land use and zoning designations and development standards for the project site. Therefore, once the proposed project is approved, the project would not result in an inconsistency with the land use designation. Therefore, the proposed would not be anticipated to exceed the AQMP assumptions for the project site and would be consistent with the AQMP for the second criterion.

Based on the above, the proposed project would not conflict with implementation of the AQMP, impacts are considered to be less than significant.

## **XI. MITIGATION MEASURES**

---

### **A. Construction Measures**

The project is required to comply with SCAQMD Rule 403 - Fugitive Dust. No construction mitigation is required.

### **B. Operational Measures**

Mitigation Measure 1. The project applicant shall provide sidewalks within the project boundary and along the off-site roadway improvements.

Mitigation Measure 2. The project applicant shall require that any future tenants institute a ride sharing program and employee vanpool/shuttle that is open to all employees.

Mitigation Measure 3. The project applicant shall require that all building structures meet or exceed 2013 Title 24 Standards and Green Building Code Standards.

Mitigation Measure 4. The project applicant shall require that all lighting installed in the proposed structures uses on average a minimum of 5 percent less energy than conventional metal halide warehouse lighting.

Mitigation Measure 5. The project applicant shall require that all faucets, toilets and showers installed in the proposed structures utilize low-flow fixtures that would reduce indoor water demand by 20% per CalGreen Standards.

Mitigation Measure 6. The project applicant shall require that ENERGY STAR-compliant appliances are installed on-site.

Mitigation Measure 7. The project applicant shall require all future tenants to institute recycling programs that reduces waste to landfills by a minimum of 50 percent (75 percent by 2020) and includes designated recycling bins at each proposed structure and requires all green waste to be processed at a recycling or composting facility.

**1.3 User Entered Comments & Non-Default Data**

Project Characteristics -

Land Use - Total site is 25.25 acres. Building 564,652 sf, gross landscaping 103,585 sf, parking lot including 281 warehouse & 171 trailer parking stalls = 452 parking stalls.

Construction Phase - As per developer, construction start 6/2016 and end 3/2017.

Demolition - Building square foot of 16,332 obtained from Google Earth.

Grading - Total site is 25.25 acres. As per developer, site to be balanced.

Architectural Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A interior 846,978 exterior 291,366 (including 5% of parking lot sf)

Vehicle Trips - Vehicle trips provided by TIA of 1.68 trips/TSF/day. Trip length increased to 40 miles for C-W (trucks) per SCAQMD recs. Trip % changed to 20.43 for C-W (trucks) and 79.57 C-NW for cars to match TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Area Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A 846,978 interior 291,366 exterior (including 5% of parking lot sf)

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation - Light industrial uses have 1030 sf/employee. Site is 0.14 miles to Omnitrans Route 9. Approximately 1.9 miles southeast of downtown San Bernardino.

Area Mitigation - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC.

Energy Mitigation - 2013 Title 24 commercial standards are 30% more efficient than 2008 standards. Project to install high efficiency lighting that reduces energy by 5% or more. Project will be LEED Silver. Energy Star appliances installed on-site.

Water Mitigation - 20% reduction in indoor water use and use of water efficient irrigation systems, per Green Building Standards.

Waste Mitigation - AB 939 requires each jurisdiction in California to divert at least 50 percent of its waste away from landfills.

Mobile Commute Mitigation - Passenger cars make up 79.57% of project-related traffic. All employees driving cars are eligible for vanpool/shuttle/ride share programs.

**1.3 User Entered Comments & Non-Default Data**

## Project Characteristics -

Land Use - Total site is 25.25 acres. Building 564,652 sf, gross landscaping 103,585 sf, parking lot including 281 warehouse & 171 trailer parking stalls = 452 parking stalls.

Construction Phase - As per developer, construction start 6/2016 and end 3/2017.

Demolition - Building square foot of 16,332 obtained from Google Earth.

Grading - Total site is 25.25 acres. As per developer, site to be balanced.

Architectural Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A interior 846,978 exterior 291,366 (including 5% of parking lot sf)

Vehicle Trips - Vehicle trips provided by TIA of 1.68 trips/TSF/day. Trip length increased to 40 miles for C-W (trucks) per SCAQMD recs. Trip % changed to 20.43 for C-W (trucks) and 79.57 C-NW for cars to match TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Area Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A 846,978 interior 291,366 exterior (including 5% of parking lot sf)

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation - Light industrial uses have 1030 sf/employee. Site is 0.14 miles to Omnitrans Route 9. Approximately 1.9 miles southeast of downtown San Bernardino.

Area Mitigation - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC.

Energy Mitigation - 2013 Title 24 commercial standards are 30% more efficient than 2008 standards. Project to install high efficiency lighting that reduces energy by 5% or more. Project will be LEED Silver. Energy Star appliances installed on-site.

Water Mitigation - 20% reduction in indoor water use and use of water efficient irrigation systems, per Green Building Standards.

Waste Mitigation - AB 939 requires each jurisdiction in California to divert at least 50 percent of its waste away from landfills.

Mobile Commute Mitigation - Passenger cars make up 79.57% of project-related traffic. All employees driving cars are eligible for vanpool/shuttle/ride share programs.

**APPENDIX C**

**AERMOD Model Printouts**

## Emission Assumptions

DPM

Emissions

Waterman

### Facility Operations

Buildout year:

2017

### Emission Factors

#### 1) Onsite Vehicle Emissions

##### a) Truck

##### (1) EMFAC2011

##### (a) Annual Meteorology

Temperature: 65 degF

Relative Humidity: 50%

##### (b) Calculations for SB County

##### (c) Truck Mix

4+ axle heavy-heavy duty diesel trucks (HHDT)

4 axle diesel trucks (MHDT)

2 axle diesel trucks (LHDT2)

(d) Onsite Truck Travel Speed: 10 mph

(e) Off-site Truck Travel Speed: 35 mph

(f) Idle speed: 0 mph

(g) Truck Idle time: 15 minutes per truck per day

#### 2) Other Parameters

(a) Width of Volume Source: 12 feet

(b) Truck Operational Schedule: 24 hours/day

***      MODEL SETUP OPTIONS SUMMARY      ***

```

```

-- -- -- -- --
**Model Is Setup For Calculation of Average CONCentration Values.

```

```

-- DEPOSITION LOGIC --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT = F
**Model Uses NO WET DEPLETION.  WETDPLT = F

```

```

**Model Uses URBAN Dispersion Algorithm for the SBL for 587 Source(s),
for Total of 1 Urban Area(s):
Urban Population = 219288.0 ; Urban Roughness Length = 1.000 m

```

```

**Model Allows User-Specified Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

```

```

**Other Options Specified:
FASTALL - Use effective sigma-y to optimize meander for
          POINT and VOLUME sources, and hybrid approach
          to optimize AREA sources (formerly TOXICS option)
TEMP_Sub - Meteorological data includes TEMP substitutions

```

```

**Model Assumes No FLAGPOLE Receptor Heights.

```

\*\*The User Specified a Pollutant Type of: DPM

\*\*Model Calculates ANNUAL Averages Only

\*\*This Run Includes: 587 Source(s); 1 Source Group(s); and 457 Receptor(s)

with: 6 POINT(s), including  
0 POINTCAP(s) and 0 POINTHOR(s)  
and: 581 VOLUME source(s)  
and: 0 AREA type source(s)  
and: 0 LINE source(s)  
and: 0 OPENPIT source(s)

\*\*Model Set To Continue RUNNING After the Setup Testing.

\*\*The AERMET Input Meteorological Data Version Date: 14134

\*\*Output Options Selected:

Model Outputs Tables of ANNUAL Averages by Receptor  
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)  
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

\*\*NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours  
m for Missing Hours  
b for Both Calm and Missing Hours

\*\*Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 305.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0  
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07  
Output Units = MICROGRAMS/M\*\*3

\*\*Approximate Storage Requirements of Model = 4.6 MB of RAM.

\*\*Detailed Error/Message File: 5629b Waterman.err  
\*\*File for Summary of Results: 5629b Waterman.sum

**1.3 User Entered Comments & Non-Default Data**

Project Characteristics -

Land Use - Total site is 25.25 acres. Building 564,652 sf, gross landscaping 103,585 sf, parking lot including 281 warehouse & 171 trailer parking stalls = 452 parking stalls.

Construction Phase - As per developer, construction start 6/2016 and end 3/2017.

Demolition - Building square foot of 16,332 obtained from Google Earth.

Grading - Total site is 25.25 acres. As per developer, site to be balanced.

Architectural Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A interior 846,978 exterior 291,366 (including 5% of parking lot sf)

Vehicle Trips - Vehicle trips provided by TIA of 1.68 trips/TSF/day. Trip length increased to 40 miles for C-W (trucks) per SCAQMD recs. Trip % changed to 20.43 for C-W (trucks) and 79.57 C-NW for cars to match TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Area Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A 846,978 interior 291,366 exterior (including 5% of parking lot sf)

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation - Light industrial uses have 1030 sf/employee. Site is 0.14 miles to Omnitrans Route 9. Approximately 1.9 miles southeast of downtown San Bernardino.

Area Mitigation - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC.

Energy Mitigation - 2013 Title 24 commercial standards are 30% more efficient than 2008 standards. Project to install high efficiency lighting that reduces energy by 5% or more. Project will be LEED Silver. Energy Star appliances installed on-site.

Water Mitigation - 20% reduction in indoor water use and use of water efficient irrigation systems, per Green Building Standards.

Waste Mitigation - AB 939 requires each jurisdiction in California to divert at least 50 percent of its waste away from landfills.

Mobile Commute Mitigation - Passenger cars make up 79.57% of project-related traffic. All employees driving cars are eligible for vanpool/shuttle/ride share programs.

## **I. INTRODUCTION AND SETTING**

---

### **A. Purpose and Objectives**

This study was performed to address the possibility of regional and local air quality impacts, global climate change impacts, and cancer risk from diesel emissions. The objectives of the study include:

- documentation of the atmospheric setting
- discussion of criteria pollutants and greenhouse gases
- discussion of the air quality and global climate change regulatory framework
- discussion of the air quality, greenhouse gases, and cancer risk thresholds of significance
- analysis of the construction related air quality and greenhouse gas emissions
- analysis of the operations related air quality and greenhouse gas emissions
- analysis of the operations related cancer risk from diesel emissions
- recommendations for mitigation measures
- analysis of the conformity of the proposed project with the SCAQMD AQMP

The City of San Bernardino is the lead agency responsible for preparation of this air quality analysis, in accordance with the California Environmental Quality Act authorizing legislation. Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with terms unique to air quality and global climate change, a definition of terms has been provided in Appendix A.

### **B. Project Location**

The project is located on the southwest corner of the Waterman Avenue and Dumas Drive intersection in the City of San Bernardino. A vicinity map showing the project location is provided on Figure 1.

According to the SCAQMD's MATES-IV study, the project area has an estimated ambient cancer risk of 336.39 in one million. This increased cancer risk is largely due to the proximity to the I-10 and I-215 Freeways. In comparison the average cancer risk for San Bernardino County is 339 in one million.

### **C. Project Description**

The approximately 25.25 acre project site is proposed to be developed with a 564,652 square foot high-cube warehouse distribution center with 452 total parking stalls, including 281 warehouse parking spaces and 171 trailer parking spaces, and 24 bicycle stalls. The project also includes 103,585 gross square feet of landscaping. The proposed project will have access to Waterman Avenue and Dumas Drive. Figure 2 illustrates the project site plan.

**D. Phasing and Timing**

The project will be constructed in one phase. The construction of the project is expected to begin June 2016 and be completed in March 2017. The project will be operational in 2017.

**E. Sensitive Receptors in Project Vicinity**

For the purposes of a CEQA analysis, the SCAQMD considers a sensitive receptor to be a receptor such as a residence, hospital, or convalescent facility where it is possible that an individual could remain at the location for 24 hours. SCAQMD also considers land uses such as schools, child care centers, athletic facilities, and playgrounds to be sensitive receptors. Commercial and industrial facilities are not included in the definition of sensitive receptor because employees do not typically remain on-site for a full 24 hours, but are present for shorter periods of time, such as eight hours.

The nearest sensitive receptors to the project site are the single-family detached residential dwelling units on the north side of Dumas Street (approximately 65 feet from the project's northern property line), the single-family detached residential dwelling unit to the west of the project site (approximately 170 feet from the western property line). The San Bernardino Public Golf Course is located adjacent to the southern and southwestern property line.

**F. Executive Summary of Findings**

*Construction-Source Emissions*

Project construction-source emissions would not exceed applicable regional thresholds of significance established by the SCAQMD. For localized emissions, the project will not exceed applicable Localized Significance Thresholds (LSTs) established by the SCAQMD.

Project construction-source emissions would not conflict with the Basin Air Quality Management Plan (AQMP). As discussed herein, the project will comply with all applicable SCAQMD construction-source emission reduction rules and guidelines. Project construction source emissions would not cause or substantively contribute to violation of the California Ambient Air Quality Standards (CAAQS) or National Ambient Air Quality Standards (NAAQS).

Established requirements addressing construction equipment operations, and construction material use, storage, and disposal requirements act to minimize odor impacts that may result from construction activities. Moreover, construction-source odor emissions would be temporary, short-term, and intermittent in nature and would not result in persistent impacts that would affect substantial numbers of people. Potential construction-source odor impacts are therefore considered less-than-significant.

*Operational-Source Emissions*

The project operational-sourced emissions would not exceed applicable regional thresholds of significance established by the SCAQMD. Project operational-source emissions would not result in or cause a significant localized air quality impact as discussed in the Operations-Related Local Air Quality Impacts section of this report. Additionally, project-related traffic will not cause or result in CO concentrations exceeding applicable state

and/or federal standards (CO “hotspots). The Diesel Emissions Health Risk Assessment conducted for this project showed that DPM emissions from project-related truck traffic will not cause a significantly elevated cancer risk or significant non-cancer-related health risk to nearby receptors. Project operational-source emissions would therefore not adversely affect sensitive receptors within the vicinity of the project.

Project operational-source emissions would not conflict with the Basin Air Quality Management Plan (AQMP). The project's emissions meet SCAQMD regional thresholds and will not result in a significant cumulative impact. The project does not propose any such uses or activities that would result in potentially significant operational-source odor impacts. Potential operational-source odor impacts are therefore considered less-than significant.

Project-related GHG emissions are also considered to be less than significant, with mitigation, and the project does not conflict with the goals of the SANBAG GHG Reduction Plan for the City of San Bernardino.

Figure 1  
Project Location Map

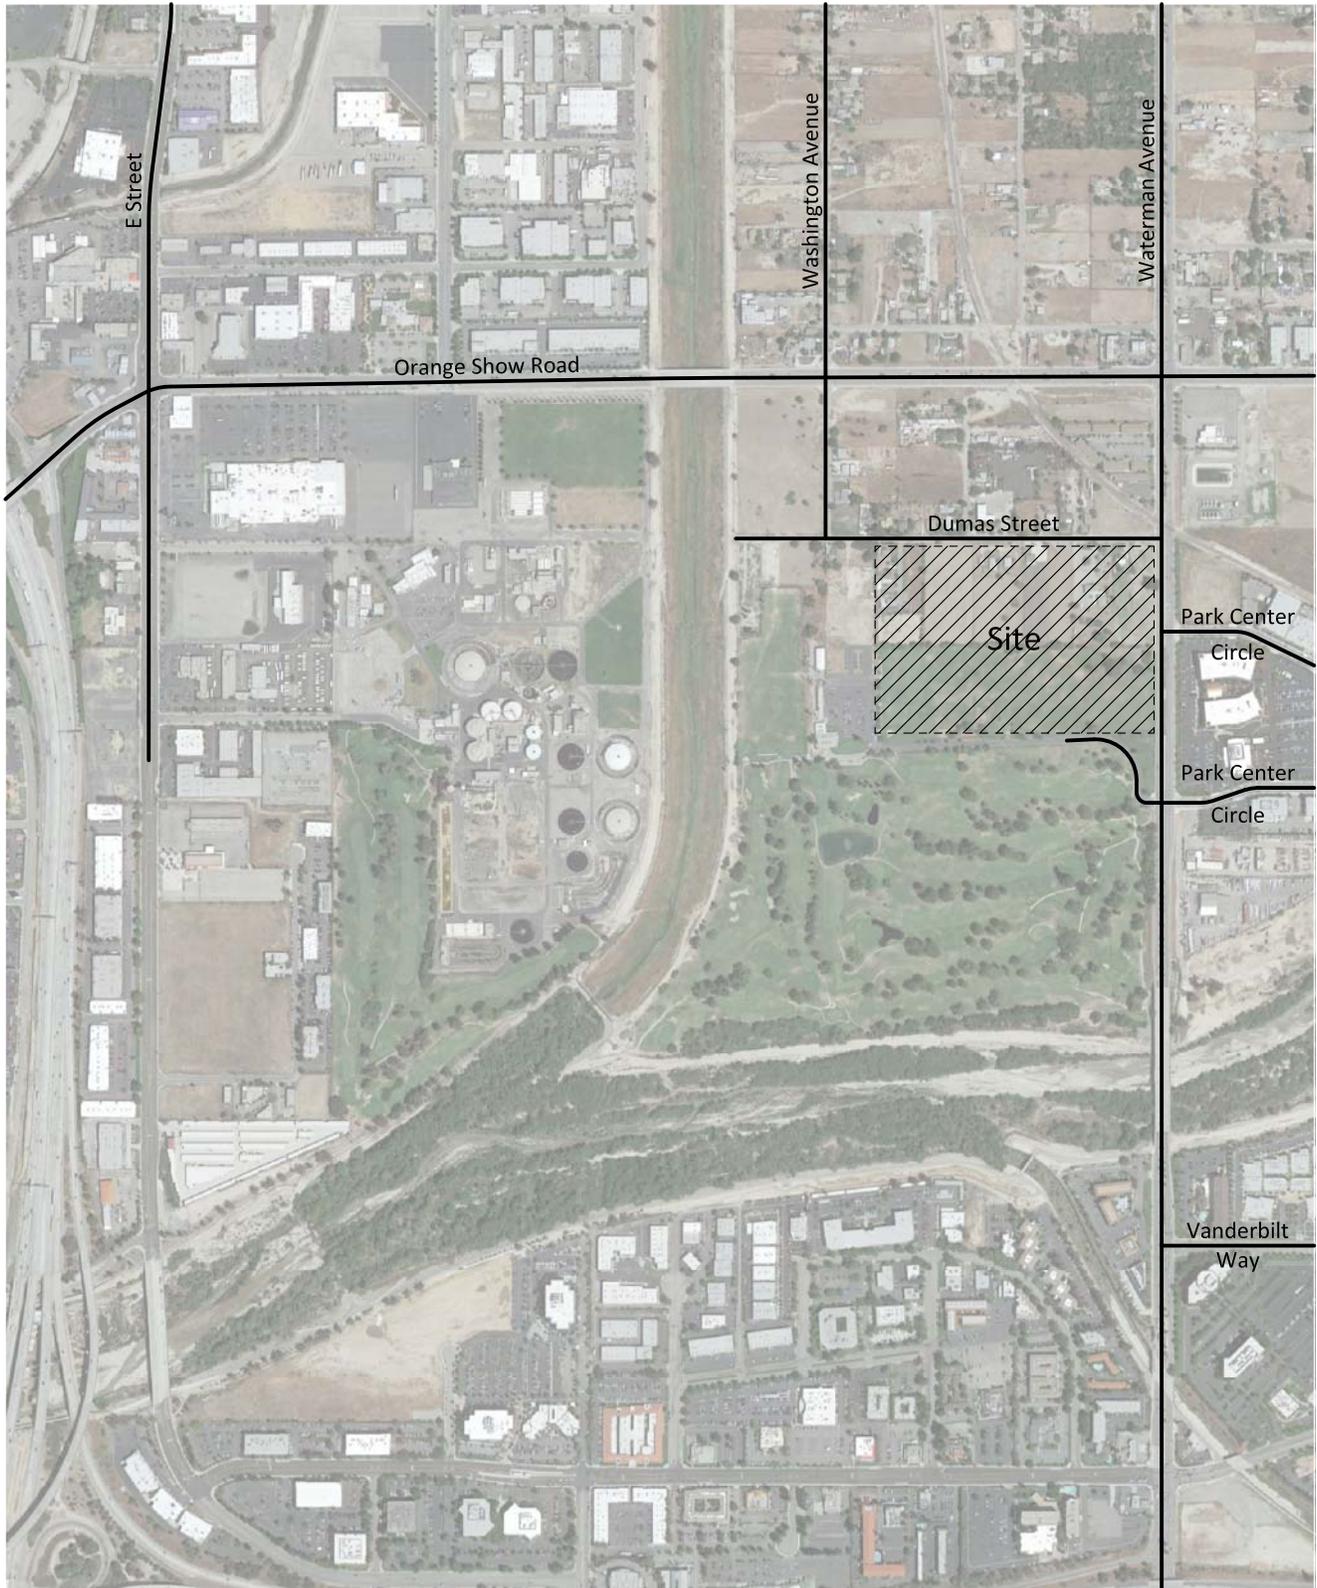

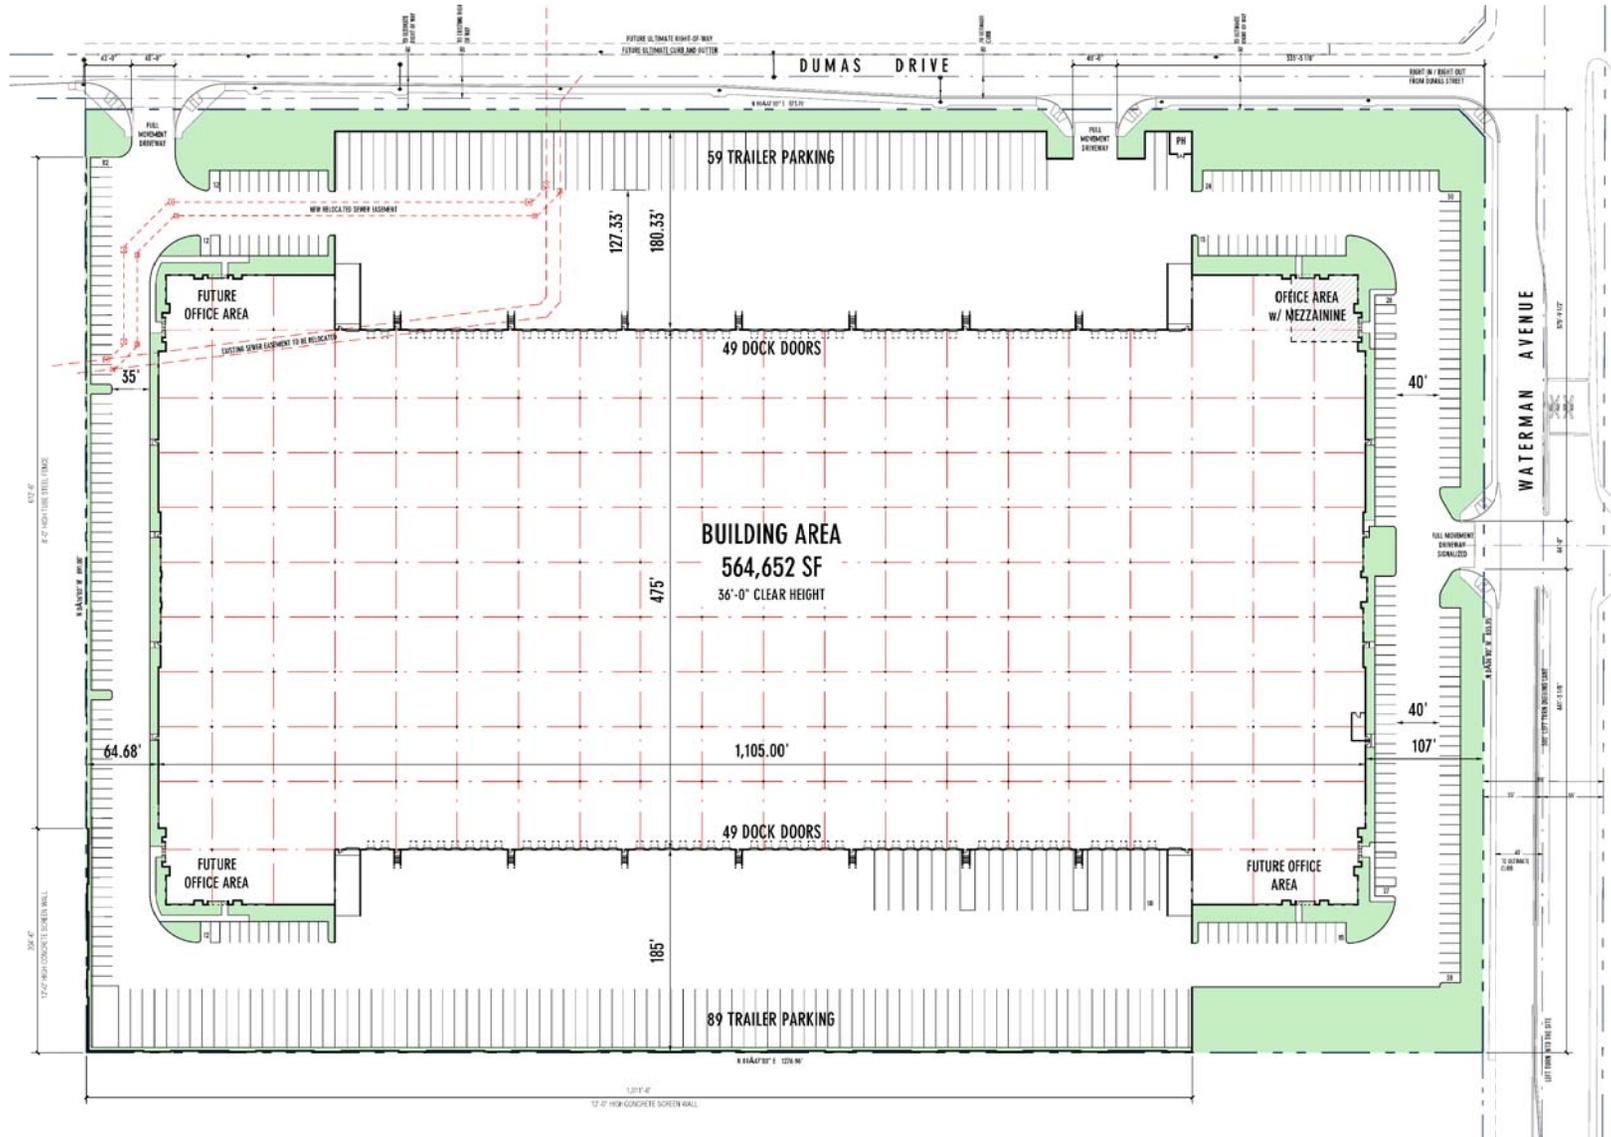

Figure 2  
Site Plan

## II. ATMOSPHERIC SETTING

---

The project site is located within the western portion of San Bernardino County, which is part of the South Coast Air Basin (SCAB) that includes all of Orange County as well as the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The South Coast Air Basin is located on a coastal plain with connecting broad valleys and low hills to the east. Regionally, the South Coast Air Basin is bounded by the Pacific Ocean to the southwest and high mountains to the east forming the inland perimeter. The project site is located toward the northeast portion of the South Coast Air Basin near the foot of the San Bernardino Mountains, which define the eastern boundary of the South Coast Air Basin.

The climate of western San Bernardino County, technically called an interior valley subclimate of the Southern California's Mediterranean-type climate, is characterized by hot dry summers, mild moist winters with infrequent rainfall, moderate afternoon breezes, and generally fair weather. Occasional periods of strong Santa Ana winds and winter storms interrupt the otherwise mild weather pattern. The clouds and fog that form along the area's coastline rarely extend as far inland as western San Bernardino County. When morning clouds and fog form, they typically burn off quickly after sunrise. The most important weather pattern from an air quality perspective is associated with the warm season airflow across the populated areas of the Los Angeles Basin. This airflow brings polluted air into western San Bernardino County late in the afternoon. This transport pattern creates unhealthy air quality that may extend to the project site particularly during the summer months.

Winds are an important parameter in characterizing the air quality environment of a project site because they both determine the regional pattern of air pollution transport and control the rate of dispersion near a source. Daytime winds in western San Bernardino County are usually light breezes from off the coast as air moves regionally onshore from the cool Pacific Ocean to the warm Mojave Desert interior of Southern California. These winds allow for good local mixing, but as discussed above, these coastal winds carry significant amounts of industrial and automobile air pollutants from the densely urbanized western portion of the South Coast Air Basin into the interior valleys which become trapped by the mountains that border the eastern edge of the South Coast Air Basin.

In the summer, strong temperature inversions may occur that limit the vertical depth through which air pollution can be dispersed. Air pollutants concentrate because they cannot rise through the inversion layer and disperse. These inversions are more common and persistent during the summer months. Over time, sunlight produces photochemical reactions within this inversion layer that creates ozone, a particularly harmful air pollutant. Occasionally, strong thermal convections occur which allows the air pollutants to rise high enough to pass over the mountains and ultimately dilute the smog cloud.

In the winter, light nocturnal winds result mainly from the drainage of cool air off of the mountains toward the valley floor while the air aloft over the valley remains warm. This forms a type of inversion known as a radiation inversion. Such winds are characterized by stagnation and poor local mixing and trap pollutants such as automobile exhaust near their source. While these inversions may lead to air pollution "hot spots" in heavily developed coastal areas of the basin,

there is not enough traffic in inland valleys to cause any winter air pollution problems. Despite light wind conditions, especially at night and in the early morning, winter is generally a period of good air quality in the project vicinity.

The temperature and precipitation levels for the City of San Bernardino are shown below in Table 1. Table 1 shows that August is typically the warmest month and December is typically the coolest month. Rainfall in the project area varies considerably in both time and space. Almost all the annual rainfall comes from the fringes of mid-latitude storms from late November to early April, with summers being almost completely dry.

### III. POLLUTANTS

---

---

Pollutants are generally classified as either criteria pollutants or non-criteria pollutants. Federal ambient air quality standards have been established for criteria pollutants, whereas no ambient standards have been established for non-criteria pollutants. For some criteria pollutants, separate standards have been set for different periods. Most standards have been set to protect public health. For some pollutants, standards have been based on other values (such as protection of crops, protection of materials, or avoidance of nuisance conditions). A summary of federal and state ambient air quality standards is provided in the Regulatory Framework section.

#### A. Criteria Pollutants

The criteria pollutants consist of: ozone, nitrogen dioxide, carbon monoxide, sulfur dioxide, lead, and particulate matter. These pollutants can harm your health and the environment, and cause property damage. The Environmental Protection Agency (EPA) calls these pollutants “criteria” air pollutants because it regulates them by developing human health-based and/or environmentally-based criteria for setting permissible levels. The following provides descriptions of each of the criteria pollutants.

##### 1. Nitrogen Dioxide (NO<sub>2</sub>)

Nitrogen Oxides (NO<sub>x</sub>) is the generic term for a group of highly reactive gases which contain nitrogen and oxygen. While most NO<sub>x</sub> are colorless and odorless, concentrations of nitrogen dioxide (NO<sub>2</sub>) can often be seen as a reddish-brown layer over many urban areas. NO<sub>x</sub> form when fuel is burned at high temperatures, as in a combustion process. The primary manmade sources of NO<sub>x</sub> are motor vehicles, electric utilities, and other industrial, commercial, and residential sources that burn fuel. NO<sub>x</sub> reacts with other pollutants to form, ground-level ozone, nitrate particles, acid aerosols, as well as NO<sub>2</sub>, which cause respiratory problems. NO<sub>x</sub> and the pollutants formed from NO<sub>x</sub> can be transported over long distances, following the patterns of prevailing winds. Therefore controlling NO<sub>x</sub> is often most effective if done from a regional perspective, rather than focusing on the nearest sources.

##### 2. Ozone (O<sub>3</sub>)

Ozone is not usually emitted directly into the air but at ground-level is created by a chemical reaction between NO<sub>x</sub> and volatile organic compounds (VOC) in the presence of sunlight. Motor vehicle exhaust, industrial emissions, gasoline vapors, chemical solvents as well as natural sources emit NO<sub>x</sub> and VOC that help form ozone. Ground-level ozone is the primary constituent of smog. Sunlight and hot weather cause ground-level ozone to form with the greatest concentrations usually occurring downwind from urban areas. Ozone is subsequently considered a regional pollutant. Ground-level ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and can cause substantial damage to vegetation and other materials. Because NO<sub>x</sub> and VOC are ozone precursors, the health effects associated

with ozone are also indirect health effects associated with significant levels of NO<sub>x</sub> and VOC emissions.

3. Carbon Monoxide (CO)

Carbon monoxide (CO) is a colorless, odorless gas that is formed when carbon in fuel is not burned completely. It is a component of motor vehicle exhaust, which contributes about 56 percent of all CO emissions nationwide. In cities, 85 to 95 percent of all CO emissions may come from motor vehicle exhaust. Other sources of CO emissions include industrial processes (such as metals processing and chemical manufacturing), residential wood burning, and natural sources such as forest fires. Woodstoves, gas stoves, cigarette smoke, and unvented gas and kerosene space heaters are indoor sources of CO. The highest levels of CO in the outside air typically occur during the colder months of the year when inversion conditions are more frequent. The air pollution becomes trapped near the ground beneath a layer of warm air. CO is described as having only a local influence because it dissipates quickly. Since CO concentrations are strongly associated with motor vehicle emissions, high CO concentrations generally occur in the immediate vicinity of roadways with high traffic volumes and traffic congestion, active parking lots, and in automobile tunnels. Areas adjacent to heavily traveled and congested intersections are particularly susceptible to high CO concentrations.

CO is a public health concern because it combines readily with hemoglobin and thus reduces the amount of oxygen transported in the bloodstream. The health threat from lower levels of CO is most serious for those who suffer from heart disease such as angina, clogged arteries, or congestive heart failure. For a person with heart disease, a single exposure to CO at low levels may cause chest pain and reduce that person's ability to exercise; repeated exposures may contribute to other cardiovascular effects. High levels of CO can affect even healthy people. People who breathe high levels of CO can develop vision problems, reduced ability to work or learn, reduced manual dexterity, and difficulty performing complex tasks. At extremely high levels, CO is poisonous and can cause death.

4. Sulfur Dioxide (SO<sub>2</sub>)

Sulfur Oxide (SO<sub>x</sub>) gases (including sulfur dioxide [SO<sub>2</sub>]) are formed when fuel containing sulfur, such as coal and oil is burned, and from the refining of gasoline. SO<sub>x</sub> dissolves easily in water vapor to form acid and interacts with other gases and particles in the air to form sulfates and other products that can be harmful to people and the environment.

5. Lead (Pb)

Lead is a metal found naturally in the environment as well as manufactured products. The major sources of lead emissions have historically been motor vehicles and industrial sources. Due to the phase out of leaded gasoline, metal processing is now the primary source of lead emissions to the air. High levels of lead in the air are typically only found near lead smelters, waste incinerators, utilities, and lead-acid

battery manufacturers. Exposure of fetuses, infants and children to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure.

6. Particulate Matter (PM)

Particulate matter (PM) is the term for a mixture of solid particles and liquid droplets found in the air. Particulate matter is made up of a number of components including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. The size of particles is directly linked to their potential for causing health problems. Particles that are less than 10 micrometers in diameter (PM10) are the particles that generally pass through the throat and nose and enter the lungs. Once inhaled, these particles can affect the heart and lungs and cause serious health effects. Particles that are less than 2.5 micrometers in diameter (PM2.5) have been designated as a subset of PM10 due to their increased negative health impacts and its ability to remain suspended in the air longer and travel further.

7. Volatile Organic Compounds (VOCs)

Although not a criteria pollutant, reactive organic gases (ROGs), or VOCs, are defined as any compound of carbon—excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate—that participates in atmospheric photochemical reactions. Although there are slight differences in the definition of ROGs and VOCs, the two terms are often used interchangeably. Indoor sources of VOCs include paints, solvents, aerosol sprays, cleansers, tobacco smoke, etc. Outdoor sources of VOCs are from combustion and fuel evaporation. A reduction in VOC emissions reduces certain chemical reactions that contribute to the formulation of ozone. VOCs are transformed into organic aerosols in the atmosphere, which contribute to higher PM10 and lower visibility.

**B. Other Pollutants of Concern**

1. Toxic Air Contaminants

In addition to the above-listed criteria pollutants, toxic air contaminants (TACs) are another group of pollutants of concern. Sources of toxic air contaminants include industrial processes such as petroleum refining and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. Cars and trucks release at least forty different toxic air contaminants. The most important of these toxic air contaminants, in terms of health risk, are diesel particulates, benzene, formaldehyde, 1,3-butadiene, and acetaldehyde. Public exposure to toxic air contaminants can result from emissions from normal operations as well as accidental releases. Health effects of toxic air contaminants include cancer, birth defects, neurological damage, and death.

Toxic air contaminants are less pervasive in the urban atmosphere than criteria air pollutants, however they are linked to short-term (acute) or long-term (chronic or carcinogenic) adverse human health effects. There are hundreds of different types of toxic air contaminants with varying degrees of toxicity. Sources of toxic air contaminants include industrial processes, commercial operations (e.g., gasoline stations and dry cleaners), and motor vehicle exhaust.

According to the 2005 California Almanac of Emissions and Air Quality, the majority of the estimated health risk from toxic air contaminants can be attributed to relatively few compounds, the most important of which is diesel particulate matter (DPM). Diesel particulate matter is a subset of PM<sub>2.5</sub> because the size of diesel particles are typically 2.5 microns and smaller. The identification of diesel particulate matter as a toxic air contaminant in 1998 led the California Air Resources Board (CARB) to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-fueled Engines and Vehicles in September 2000. The plan's goals are a 75-percent reduction in diesel particulate matter by 2010 and an 85-percent reduction by 2020 from the 2000 baseline. Diesel engines emit a complex mixture of air pollutants, composed of gaseous and solid material. The visible emissions in diesel exhaust are known as particulate matter or PM, which includes carbon particles or "soot". Diesel exhaust also contains a variety of harmful gases and over 40 other cancer-causing substances. California's identification of diesel particulate matter as a toxic air contaminant was based on its potential to cause cancer, premature deaths, and other health problems. Exposure to diesel particulate matter is a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. Overall, diesel engine emissions are responsible for the majority of California's potential airborne cancer risk from combustion sources.

## 2. Asbestos

Asbestos is listed as a TAC by ARB and as a Hazardous Air Pollutant by the EPA. Asbestos occurs naturally in mineral formations and crushing or breaking these rocks, through construction or other means, can release asbestiform fibers into the air. Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. The risk of disease is dependent upon the intensity and duration of exposure. When inhaled, asbestos fibers may remain in the lungs and with time may be linked to such diseases as asbestosis, lung cancer, and mesothelioma. Naturally occurring asbestos is not present in San Bernardino County. The nearest likely locations of naturally occurring asbestos, as identified in the General Location Guide for Ultramafic Rocks in California prepared by the California Division of Mines and Geology, is located in Santa Barbara County. Due to the distance to the nearest natural occurrences of asbestos, the project site is not likely to contain asbestos.

## C. Greenhouse Gases

Constituent gases of the Earth's atmosphere, called atmospheric greenhouse gases (GHG), play a critical role in the Earth's radiation amount by trapping infrared radiation emitted from the Earth's surface, which otherwise would have escaped to space. Prominent

greenhouse gases contributing to this process include carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), ozone, water vapor, nitrous oxide (N<sub>2</sub>O), and chlorofluorocarbons (CFCs). This phenomenon, known as the Greenhouse Effect, is responsible for maintaining a habitable climate. Anthropogenic (caused or produced by humans) emissions of these greenhouse gases in excess of natural ambient concentrations are responsible for the enhancement of the Greenhouse Effect and have led to a trend of unnatural warming of the Earth's natural climate, known as global warming or climate change. Emissions of gases that induce global warming are attributable to human activities associated with industrial/manufacturing, agriculture, utilities, transportation, and residential land uses. Transportation is responsible for 41 percent of the State's greenhouse gas emissions, followed by electricity generation. Emissions of CO<sub>2</sub> and nitrous oxide (NO<sub>x</sub>) are byproducts of fossil fuel combustion. Methane, a potent greenhouse gas, results from off-gassing associated with agricultural practices and landfills. Sinks of CO<sub>2</sub>, where CO<sub>2</sub> is stored outside of the atmosphere, include uptake by vegetation and dissolution into the ocean. The following provides a description of each of the greenhouse gases and their global warming potential.

1. Water Vapor

Water vapor is the most abundant, important, and variable GHG in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. The feedback loop in which water is involved in is critically important to projecting future climate change. As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to "hold" more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive feedback loop". The extent to which this positive feedback loop will continue is unknown as there is also dynamics that put the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it will eventually also condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the Earth's surface and heat it up).

2. Carbon Dioxide

The natural production and absorption of CO<sub>2</sub> is achieved through the terrestrial biosphere and the ocean. However, humankind has altered the natural carbon cycle by burning coal, oil, natural gas, and wood. Since the industrial revolution began in the mid 1700s. Each of these activities has increased in scale and distribution. CO<sub>2</sub> was the first GHG demonstrated to be increasing in atmospheric concentration with the first conclusive measurements being made in the last half of the 20th century. Prior to the industrial revolution, concentrations were fairly stable at 280 parts per million (ppm). The International Panel on Climate Change (IPCC) indicates that concentrations were 379 ppm in 2005, an increase of more than 30 percent. Left

unchecked, the IPCC projects that concentration of carbon dioxide in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of anthropogenic sources. This could result in an average global temperature rise of at least two degrees Celsius.

3. Methane

CH<sub>4</sub> is an extremely effective absorber of radiation, although its atmospheric concentration is less than that of CO<sub>2</sub>. Its lifetime in the atmosphere is brief (10 to 12 years), compared to some other GHGs (such as CO<sub>2</sub>, N<sub>2</sub>O, and Chlorofluorocarbons (CFCs)). CH<sub>4</sub> has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of methane. Other anthropogenic sources include fossil-fuel combustion and biomass burning.

4. Nitrous Oxide

Concentrations of N<sub>2</sub>O also began to rise at the beginning of the industrial revolution. In 1998, the global concentration was 314 parts per billion (ppb). N<sub>2</sub>O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used as an aerosol spray propellant (i.e., in whipped cream bottles, in potato chip bags to keep chips fresh, and in rocket engines and in race cars).

5. Chlorofluorocarbons

CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane (C<sub>2</sub>H<sub>6</sub>) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the Earth's surface). CFCs have no natural source, but were first synthesized in 1928. It was used for refrigerants, aerosol propellants, and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken. This effort was extremely successful, and the levels of the major CFCs are now remaining level or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years.

6. Hydrofluorocarbons

HFCs are synthetic man-made chemicals that are used as a substitute for CFCs. Out of all the GHGs, they are one of three groups with the highest global warming potential. The HFCs with the largest measured atmospheric abundances are (in order), HFC-23 (CHF<sub>3</sub>), HFC-134a (CF<sub>3</sub>CH<sub>2</sub>F), and HFC-152a (CH<sub>3</sub>CHF<sub>2</sub>). Prior to 1990, the only significant emissions were HFC-23. HFC-134a use is increasing due to its use as a refrigerant. Concentrations of HFC-23 HFC-134a are now about 10 parts per trillion

(ppt) each. Concentrations of HFC-152a are about 1 ppt. HFCs are manmade for applications such as automobile air conditioners and refrigerants.

7. Perfluorocarbons

PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth's surface are able to destroy the compounds. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane ( $\text{CF}_4$ ) and hexafluoroethane ( $\text{C}_2\text{F}_6$ ). Concentrations of  $\text{CF}_4$  in the atmosphere are over 70 ppt. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing.

8. Sulfur Hexafluoride

$\text{SF}_6$  is an inorganic, odorless, colorless, nontoxic, nonflammable gas.  $\text{SF}_6$  has the highest global warming potential of any gas evaluated; 23,900 times that of  $\text{CO}_2$ . Concentrations in the 1990s were about 4 ppt. Sulfur hexafluoride is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

9. Aerosols

Aerosols are particles emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light. Cloud formation can also be affected by aerosols. Sulfate aerosols are emitted when fuel containing sulfur is burned. Black carbon (or soot) is emitted during biomass burning due to the incomplete combustion of fossil fuels. Particulate matter regulation has been lowering aerosol concentrations in the United States; however, global concentrations are likely increasing.

10. Global Warming Potential

GHGs have varying global warming potential (GWP). The global warming potential is the potential of a gas or aerosol to trap heat in the atmosphere; it is the cumulative radiative forcing effects of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to the reference gas,  $\text{CO}_2$ . One teragram of carbon dioxide equivalent (Tg  $\text{CO}_2\text{e}$ ) is essentially the emissions of the gas multiplied by the global warming potential. One teragram is equal to one million metric tons. The carbon dioxide equivalent is a good way to assess emissions because it gives weight to the global warming potential of the gas. A summary of the atmospheric lifetime and the global warming potential of selected gases are summarized in Table 2. As shown in Table 2, the global warming potential of GHGs ranges from 1 to 22,800.

**Table 2****Global Warming Potentials and Atmospheric Lifetimes<sup>1</sup>**

| Gas                                     | Atmospheric Lifetime | Global Warming Potential <sup>2</sup><br>(100 Year Horizon) |
|---|----------------------|---|
| Carbon Dioxide (CO <sub>2</sub> )       | — <sup>3</sup>       | 1   |
| Methane (CH <sub>4</sub> )              | 12                   | 28-36   |
| Nitrous Oxide (NO)                      | 114                  | 298   |
| Hydrofluorocarbons (HFCs)               | 1-270                | 12-14,800   |
| Perfluorocarbons (PFCs)                 | 2,600-50,000         | 7,390-12,200  |
| Nitrogen trifluoride (NF <sub>3</sub> ) | 740                  | 17,200  |
| Sulfur Hexafluoride (SF <sub>6</sub> )  | 3,200                | 22,800  |

<sup>1</sup> Source: <http://www3.epa.gov/climatechange/ghgemissions/gases.html>

<sup>2</sup> Compared to the same quantity of CO<sub>2</sub> emissions.

<sup>3</sup> Carbon dioxide's lifetime is poorly defined because the gas is not destroyed over time, but instead moves among different parts of the ocean-atmosphere-land system. Some of the excess carbon dioxide will be absorbed quickly (for example, by the ocean surface), but some will remain in the atmosphere for thousands of years, due in part to the very slow process by which carbon is transferred to ocean sediments.

## IV. AIR QUALITY MANAGEMENT

---

### A. Regulatory Setting

The proposed project is addressed through the efforts of various international, federal, state, regional, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for improving the air quality are discussed below.

#### 1. International

In 1988, the United Nations established the Intergovernmental Panel on Climate Change (IPCC) to evaluate the impacts of global climate change and to develop strategies that nations could implement to curtail global climate change. In 1992, the United States joined other countries around the world in signing the United Nations' Framework Convention on Climate Change (UNFCCC) agreement with the goal of controlling GHG emissions. As a result, the Climate Change Action Plan was developed to address the reduction of GHGs in the United States. The plan consists of more than 50 voluntary programs.

Additionally, the Montreal Protocol was originally signed in 1987 and substantially amended in 1990 and 1992. The Montreal Protocol stipulates that the production and consumption of compounds that deplete ozone in the stratosphere—CFCs, halons, carbon tetrachloride, and methyl chloroform—were to be phased out, with the first three by 2000 and methyl chloroform by 2005.

#### 2. Federal - United States Environmental Protection Agency

The United States Environmental Protection Agency (EPA) is responsible for setting and enforcing the National Ambient Air Quality Standards (NAAQS) for atmospheric pollutants. It regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain locomotives. The National Ambient Air Quality Standards (NAAQS) pollutants were identified using medical evidence and are shown below in Table 3.

As part of its enforcement responsibilities, the EPA requires each state with federal nonattainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain the national standards. The State Implementation Plan (SIP) must integrate federal, state, and local components and regulations to identify specific measures to reduce pollution, using a combination of performance standards and market-based programs within the timeframe identified in the State Implementation Plan (SIP).

As indicated below in Table 4, the Basin has been designated by the EPA as a non-attainment area for ozone (O<sub>3</sub>) and suspended particulates (PM<sub>10</sub> and PM<sub>2.5</sub>).

Currently, the Basin is in attainment with the ambient air quality standards for carbon monoxide (CO), lead, sulfur dioxide (SO<sub>2</sub>), and nitrogen dioxide (NO<sub>2</sub>).

In 2011, the Basin exceeded federal standards for either ozone or PM<sub>2.5</sub> at one or more locations on a total of 124 days, based on the current federal standards for 8-hour ozone and 24-hour PM<sub>2.5</sub>. Despite substantial improvements in air quality over the past few decades, some air monitoring stations in the Basin still exceed the NAAQS for ozone more frequently than any other stations in the U.S. In 2011, three of the top five stations that exceeded the 8-hour ozone NAAQS were located in the Basin (Central San Bernardino Mountains, East San Bernardino Valley, and Metropolitan Riverside County).

PM<sub>2.5</sub> in the Basin has improved significantly in recent years, with 2010 and 2011 being the cleanest years on record. In 2011, only one station in the Basin (Metropolitan Riverside County at Mira Loma) exceeded the annual PM<sub>2.5</sub> NAAQS and the 98th percentile form of the 24-hour PM<sub>2.5</sub> NAAQS, as well as the 3-year design values for these standards. Basin-wide, the federal PM<sub>2.5</sub> 24-hour standard level was exceeded in 2011 on 17 sampling days.

The Basin is currently in attainment for the federal standards for carbon monoxide (CO), lead, sulfur dioxide (SO<sub>2</sub>), and nitrogen dioxide (NO<sub>2</sub>). While the concentration level of the new 1-hour NO<sub>2</sub> federal standard (100 ppb) was exceeded in the Basin at two stations (Central Los Angeles and Long Beach) on the same day in 2011, the NAAQS NO<sub>2</sub> design value has not been exceeded. Therefore, the Basin remains in attainment of the NO<sub>2</sub> NAAQS.

The EPA designated the Los Angeles County portion of the Basin as nonattainment for the recently revised (2008) federal lead standard (0.15 µg/m<sup>3</sup>, rolling 3-month average), due to the addition of source-specific monitoring under the new federal regulation. This designation was based on two source-specific monitors in Vernon and the City of Industry exceeding the new standard in the 2007-2009 period of data used.

In *Massachusetts v. Environmental Protection Agency* (Docket No. 05–1120), argued November 29, 2006 and decided April 2, 2007, the U.S. Supreme Court held that not only did the EPA have authority to regulate greenhouse gases, but the EPA's reasons for not regulating this area did not fit the statutory requirements. As such, the U.S. Supreme Court ruled that the EPA should be required to regulate CO<sub>2</sub> and other greenhouse gases as pollutants under the federal Clean Air Act (CAA).

In response to the FY2008 Consolidations Appropriations Act (H.R. 2764; Public Law 110-161), EPA proposed a rule on March 10, 2009 that requires mandatory reporting of GHG emissions from large sources in the United States. On September 22, 2009, the Final Mandatory Reporting of GHG Rule was signed and published in the Federal Register on October 30, 2009. The rule became effective on December 29, 2009. This rule requires suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to EPA.

On December 7, 2009, the EPA Administrator signed two distinct findings under section 202(a) of the Clean Air Act. One is an endangerment finding that finds concentrations of the six GHGs in the atmosphere threaten the public health and welfare of current and future generations. The other is a cause or contribute finding, that finds emissions from new motor vehicles and new motor vehicle engines contribute to the GHG pollution which threatens public health and welfare. These actions will not themselves impose any requirements on industry or other entities. However, it is a prerequisite to finalizing the EPA's proposed GHG emission standards for light-duty vehicles, which were jointly proposed by the EPA and Department of Transportation on September 15, 2009.

On March 19, 2015, the Whitehouse announced that President Obama will issue an Executive Order that will cut the Federal Government's greenhouse gas (GHG) emissions 40 percent over the next decade from 2008 levels -- saving taxpayers up to \$18 billion in avoided energy costs -- and increase the share of electricity the Federal Government consumes from renewable sources to 30 percent. Complementing this effort, several major Federal suppliers are announcing commitments to cut their own GHG emissions. Today, the Administration is hosting a roundtable that will bring some of these large Federal suppliers together to discuss the benefits of their GHG reduction targets or to make their first-ever corporate commitments to disclose emissions and set new reduction goals.

Together, the combined results of the Federal Government actions and new supplier commitments will reduce GHG emissions by 26 million metric tons by 2025 from 2008 levels, the equivalent of taking nearly 5.5 million cars off the road for a year. And to encourage continued progress across the Federal supply chain, the Administration is releasing a new scorecard to publicly track self-reported emissions disclosure and progress for all major Federal suppliers, who together represent more than \$187 billion in Federal spending and account for more than 40 percent of all Federal contract dollars.

Since the Federal Government is the single largest consumer of energy in the Nation, Federal emissions reductions and progress across the supply chain will have broad impacts. The new commitments announced today support the United States' international commitment to cut net GHG emissions 26-28 percent below 2005 levels by 2025, which President Obama first announced in November 2014 as part of an historic agreement with China. Additionally, the goals build on the strong progress made by Federal agencies during the first six years of the Administration under President Obama's 2009 Executive Order on Federal Leadership on Environmental, Energy and Economic Performance, including reducing Federal GHG emissions by 17 percent — which helped Federal agencies avoid \$1.8 billion in cumulative energy costs — and increasing the share of renewable energy consumption to 9 percent.<sup>1</sup>

### 3. State – California Air Resources Board

The California Air Resources Board (CARB), which is a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, the CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, provides oversight of local programs, and prepares the State Implementation Plan (SIP). The California Ambient Air Quality Standards (CAAQS) for criteria pollutants are shown in Table 3. In addition, the CARB establishes emission standards for motor vehicles sold in California, consumer products (e.g., hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

The South Coast Air Basin has been designated by the CARB as a nonattainment area for ozone, PM10 and PM2.5. Currently, the South Coast Air Basin is in attainment with the ambient air quality standards for CO, lead, SO<sub>2</sub>, NO<sub>2</sub>, and sulfates and is unclassified for visibility reducing particles and Hydrogen Sulfide.

On June 20, 2002, the CARB revised the PM10 annual average standard to 20 µg/m<sup>3</sup> and established an annual average standard for PM2.5 of 12 µg/m<sup>3</sup>. These standards were approved by the Office of Administrative Law in June 2003 and are now effective. On September 27, 2007 CARB approved the South Coast Air Basin and the Coachella Valley 2007 Air Quality Management Plan for Attaining the Federal 8-hour Ozone and PM2.5 Standards. The plan projected attainment for the 8-hour Ozone standard by 2024 and the PM2.5 standard in 2015.

The CARB is also responsible for regulations pertaining to toxic air contaminants. The Air Toxics “Hot Spots” Information and Assessment Act (AB 2588, 1987, Connelly) was enacted in 1987 as a means to establish a formal air toxics emission inventory risk quantification program. AB 2588, as amended, establishes a process that requires stationary sources to report the type and quantities of certain substances their facilities routinely release into the South Coast Air Basin. The data is ranked by high, intermediate, and low categories, which are determined by: the potency, toxicity, quantity, volume, and proximity of the facility to nearby receptors.

CARB also proposed interim statewide CEQA thresholds for GHG emissions and released Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases under the California Environmental Quality Act, on October 24, 2008. The State currently has no regulations that establish ambient air quality standards for GHGs. However, the State has passed laws directing CARB to develop actions to reduce GHG emissions, which are listed below.

#### *Assembly Bill 1493*

California Assembly Bill 1493 enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. In 2005, the CARB submitted a “waiver” request to the EPA from a portion of the federal Clean Air Act in order to allow the State to set more

stringent tailpipe emission standards for CO<sub>2</sub> and other GHG emissions from passenger vehicles and light duty trucks. On December 19, 2007 the EPA announced that it denied the “waiver” request. On January 21, 2009, CARB submitted a letter to the EPA administrator regarding the State’s request to reconsider the waiver denial. The EPA approved the waiver on June 30, 2009.

#### *Executive Order S-3-05*

The California Governor issued Executive Order S-3-05, GHG Emission, in June 2005, which established the following reduction targets:

- 2010: Reduce greenhouse gas emissions to 2000 levels
- 2020: Reduce greenhouse gas emissions to 1990 levels
- 2050: Reduce greenhouse gas emissions to 80 percent below 1990 levels.

The executive order directed the secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multi-agency effort to reduce GHG emissions to the target levels. To comply with the Executive Order, the secretary of CalEPA created the California Climate Action Team (CAT), made up of members from various state agencies and commissions. The team released its first report in March 2006. The report proposed to achieve the targets by building on the voluntary actions of businesses, local governments, and communities and through State incentive and regulatory programs.

#### *Assembly Bill 32*

In 2006, the California State Legislature adopted Assembly Bill 32 (AB 32), the California Global Warming Solutions Act of 2006. AB 32 requires CARB, to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020 through an enforceable statewide emission cap which will be phased in starting in 2012. Emission reductions shall include carbon sequestration projects that would remove carbon from the atmosphere and best management practices that are technologically feasible and cost effective.

On December 6, 2007 CARB released the calculated Year 1990 GHG emissions of 427 million metric tons of CO<sub>2</sub>e (MMTCO<sub>2</sub>e). The 2020 target of 427 MMTCO<sub>2</sub>e requires the reduction of 169 MMTCO<sub>2</sub>e, or approximately 30 percent from the State’s projected 2020 business as usual emissions of 596 MMTCO<sub>2</sub>e and the reduction of 42 MMTCO<sub>2</sub>e, or almost 10 percent from the 2002-2004 average GHG emissions. Under AB 32, CARB was required to adopt regulations by January 1, 2011 to achieve reductions in GHGs to meet the 1990 cap by 2020. Early measures CARB took to lower GHG emissions included requiring operators of the largest industrial facilities that emit 25,000 metric tons of CO<sub>2</sub> in a calendar year to submit verification of GHG emissions by December 1, 2010. The CARB Board also approved nine discrete early action measures that include regulations affecting landfills, motor vehicle fuels, refrigerants in cars, port operations and other sources that became enforceable on or before January 1, 2010.

On December 11, 2008 the CARB Board approved a Scoping Plan, with final adoption May 11, 2009 that proposed a variety of measures including direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, a market-based cap-and-trade system, and a fee regulation to fund the program. In current pending litigation, *Association of Irrigated Residents v. California Air Resources Board*, a California State trial court found that the analysis of the alternatives identified in the AB 32 Scoping Plan Functional Equivalent Document (FED) was not sufficient for informed decision-making and public review under CEQA. In response, CARB has appealed the decision. In addition, CARB prepared the *Supplement to the AB 32 Scoping Plan Functional Equivalent Document*, June 13, 2011. On August 24, 2011 CARB recertified the complete AB 32 Scoping Plan Functional Equivalent Environmental Document revised by the Final Supplement. In December, 2011 the Final Supplement was accepted as sufficient to fulfill the trial court's March order.

#### *Senate Bill 1368*

Senate Bill 1368 (SB 1368) is the companion Bill of AB 32 and was adopted September, 2006. SB 1368 requires the California Public Utilities Commission (CPUC) to establish a performance standard for baseload generation of GHG emissions by investor-owned utilities by February 1, 2007 and for local publicly owned utilities by June 30, 2007. These standards could not exceed the GHG emissions rate from a baseload combined-cycle, natural gas-fired plant. Furthermore, the legislation states that all electricity provided to the State, including imported electricity, must be generated by plants that meet the standards set by California Public Utilities Commission (CPUC) and California Energy Commission (CEC).

#### *Executive Order S-1-07*

Executive Order S-1-07 was issued in 2007 and proclaims that the transportation sector is the main source of GHG emissions in the State, since it generates more than 40 percent of the State's GHG emissions. It establishes a goal to reduce the carbon intensity of transportation fuels sold in the State by at least ten percent by 2020. This Order also directs CARB to determine whether this Low Carbon Fuel Standard (LCFS) could be adopted as a discrete early-action measure as part of the effort to meet the mandates in AB 32.

On April 23, 2009 CARB approved the proposed regulation to implement the low carbon fuel standard. The low carbon fuel standard is anticipated to reduce GHG emissions by about 16 MMT per year by 2020. The low carbon fuel standard is designed to provide a framework that uses market mechanisms to spur the steady introduction of lower carbon fuels. The framework establishes performance standards that fuel producers and importers must meet each year beginning in 2011. Separate standards are established for gasoline and diesel fuels and the alternative fuels that can replace each. The standards are "back-loaded", with more reductions required in the last five years, than the first five years. This schedule allows for the development of advanced fuels that are lower in carbon than today's fuels and the market penetration of plug-in hybrid

electric vehicles, battery electric vehicles, fuel cell vehicles, and flexible fuel vehicles. It is anticipated that compliance with the low carbon fuel standard will be based on a combination of both lower carbon fuels and more efficient vehicles.

Reformulated gasoline mixed with corn-derived ethanol at ten percent by volume and low sulfur diesel fuel represent the baseline fuels. Lower carbon fuels may be ethanol, biodiesel, renewable diesel, or blends of these fuels with gasoline or diesel as appropriate. Compressed natural gas and liquefied natural gas also may be low carbon fuels. Hydrogen and electricity, when used in fuel cells or electric vehicles are also considered as low carbon fuels for the low carbon fuel standard.

#### *Senate Bill 97*

Senate Bill 97 (SB 97) was adopted August 2007 and acknowledges that climate change is a prominent environmental issue that requires analysis under CEQA. SB 97 directed the Governor's Office of Planning and Research (OPR), which is part of the State Resource Agency, to prepare, develop, and transmit to CARB guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, by July 1, 2009. The Resources Agency was required to certify and adopt those guidelines by January 1, 2010.

Pursuant to the requirements of SB 97 as stated above, on December 30, 2009 the Natural Resources Agency adopted amendments to the state CEQA guidelines that address GHG emissions. The CEQA Guidelines Amendments changed 14 sections of the CEQA Guidelines and incorporate GHG language throughout the Guidelines. However, no GHG emissions thresholds of significance are provided and no specific mitigation measures are identified. The GHG emission reduction amendments went into effect on March 18, 2010 and are summarized below:

- Climate action plans and other greenhouse gas reduction plans can be used to determine whether a project has significant impacts, based upon its compliance with the plan.
- Local governments are encouraged to quantify the greenhouse gas emissions of proposed projects, noting that they have the freedom to select the models and methodologies that best meet their needs and circumstances. The section also recommends consideration of several qualitative factors that may be used in the determination of significance, such as the extent to which the given project complies with state, regional, or local GHG reduction plans and policies. OPR does not set or dictate specific thresholds of significance. Consistent with existing CEQA Guidelines, OPR encourages local governments to develop and publish their own thresholds of significance for GHG impacts assessment.
- When creating their own thresholds of significance, local governments may consider the thresholds of significance adopted or recommended by other public agencies, or recommended by experts.

- New amendments include guidelines for determining methods to mitigate the effects of greenhouse gas emissions in Appendix F of the CEQA Guidelines.
- OPR is clear to state that “to qualify as mitigation, specific measures from an existing plan must be identified and incorporated into the project; general compliance with a plan, by itself, is not mitigation”.
- OPR’s emphasizes the advantages of analyzing GHG impacts on an institutional, programmatic level. OPR therefore approves tiering of environmental analyses and highlights some benefits of such an approach.
- Environmental impact reports (EIRs) must specifically consider a project's energy use and energy efficiency potential.

*Senate Bills 1078, 107, and X1-2 and Executive Orders S-14-08 and S-21-09*

Senate Bill 1078 (SB 1078) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017. Senate Bill 107 (SB 107) changed the target date to 2010. Executive Order S-14-08 was signed on November 2008 and expands the State’s Renewable Energy Standard to 33 percent renewable energy by 2020. Executive Order S-21-09 directed CARB to adopt regulations by July 31, 2010 to enforce S-14-08. Senate Bill X1-2 codifies the 33 percent renewable energy requirement by 2020.

*Senate Bill 375*

Senate Bill 375 (SB 375) was adopted September 2008 and aligns regional transportation planning efforts, regional GHG emission reduction targets, and land use and housing allocation. SB 375 requires Metropolitan Planning Organizations (MPO) to adopt a sustainable communities strategy (SCS) or alternate planning strategy (APS) that will prescribe land use allocation in that MPOs Regional Transportation Plan (RTP). CARB, in consultation with each MPO, will provide each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035. These reduction targets will be updated every eight years but can be updated every four years if advancements in emissions technologies affect the reduction strategies to achieve the targets. CARB is also charged with reviewing each MPO’s sustainable communities strategy or alternate planning strategy for consistency with its assigned targets.

The proposed project is located within the Southern California Association of Governments (SCAG), which has authority to develop the SCS or APS. For the SCAG region, the targets set by CARB are at eight percent below 2005 per capita GHG emissions levels by 2020 and 13 percent below 2005 per capita GHG emissions levels by 2035. On April 4, 2012, SCAG adopted the 2012-2035 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS), which meets the CARB emission reduction requirements. The Housing Element Update is required by the State to be completed within 18 months after RTP/SCS adoption or by October 2013.

City and County land use policies, including General Plans, are not required to be consistent with the RTP and associated SCS or APS. However, new provisions of CEQA would incentivize, through streamlining and other provisions, qualified projects that are consistent with an approved SCS or APS and categorized as “transit priority projects”.

*Senate Bill X7-7*

Senate Bill X7-7 (SB X7-7), enacted on November 9, 2009, mandates water conservation targets and efficiency improvements for urban and agricultural water suppliers. SB X7-7 requires the Department of Water Resources (DWR) to develop a task force and technical panel to develop alternative best management practices for the water sector. In addition SB X7-7 required the DWR to develop criteria for baseline uses for residential, commercial, and industrial uses for both indoor and landscaped area uses. The DWR was also required to develop targets and regulations that achieve a statewide 20 percent reduction in water usage.

*Assembly Bill 939 and Senate Bill 1374*

Assembly Bill 939 (AB 939) requires that each jurisdiction in California to divert at least 50 percent of its waste away from landfills, whether through waste reduction, recycling or other means. Senate Bill 1374 (SB 1374) requires the California Integrated Waste Management Board to adopt a model ordinance by March 1, 2004 suitable for adoption by any local agency to require 50 to 75 percent diversion of construction and demolition of waste materials from landfills.

*California Code of Regulations (CCR) Title 24, Part 6*

CCR Title 24, Part 6: California’s Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24) were first established in 1978 in response to a legislative mandate to reduce California’s energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. Although it was not originally intended to reduce GHG emissions, electricity production by fossil fuels results in GHG emissions and energy efficient buildings require less electricity. Therefore, increased energy efficiency results in decreased GHG emissions.

The Energy Commission adopted 2008 Standards on April 23, 2008 and Building Standards Commission approved them for publication on September 11, 2008. These updates became effective on August 1, 2009. CalEEMod modeling defaults to 2008 standards. 2013 Standards have been approved and became effective July 1, 2014.

*California Code of Regulations (CCR) Title 24, Part 11*

All buildings for which an application for a building permit is submitted on or after January 1, 2014 must follow the 2013 standards. The 2013 commercial standards are estimated to be 30 percent more efficient than the 2008 standards; residential standards are 25 percent more efficient. Energy efficient

buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases greenhouse gas emissions.

#### *California Green Building Standards*

On January 12, 2010, the State Building Standards Commission unanimously adopted updates to the California Green Building Standards Code, which went into effect on January 1, 2011. The Code is a comprehensive and uniform regulatory code for all residential, commercial and school buildings. CCR Title 24, Part 11: California Green Building Standards (Title 24) became effective in 2001 in response to continued efforts to reduce GHG emissions associated with energy consumption. CCR Title 24, Part 11 now require that new buildings reduce water consumption, employ building commissioning to increase building system efficiencies, divert construction waste from landfills, and install low pollutant-emitting finish materials. One focus of CCR Title 24, Part 11 is water conservation measures, which reduce GHG emissions by reducing electrical consumption associated with pumping and treating water. CCR Title 24, Part 11 has approximately 52 nonresidential mandatory measures and an additional 130 provisions for optional use. Some key mandatory measures for commercial occupancies include specified parking for clean air vehicles, a 20 percent reduction of potable water use within buildings, a 50 percent construction waste diversion from landfills, use of building finish materials that emit low levels of volatile organic compounds, and commissioning for new, nonresidential buildings over 10,000 square feet.

The California Green Building Standards Code does not prevent a local jurisdiction from adopting a more stringent code as state law provides methods for local enhancements. The Code recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided they provide a minimum 50-percent diversion requirement. The code also provides exemptions for areas not served by construction and demolition recycling infrastructure. State building code provides the minimum standard that buildings need to meet in order to be certified for occupancy. Enforcement is generally through the local building official.

#### 4. Regional

The SCAQMD is the agency principally responsible for comprehensive air pollution control in the South Coast Air Basin. To that end, as a regional agency, the SCAQMD works directly with the Southern California Association of Governments (SCAG), county transportation commissions, and local governments and cooperates actively with all federal and state agencies. SCAMD defines a "sensitive receptor" as a land use such as residences, schools, child care centers, athletic facilities, playgrounds, retirement homes and convalescent homes.

#### *South Coast Air Quality Management District*

The SCAQMD develops rules and regulations, establishes permitting requirements for stationary sources, inspects emission sources, and enforces such measures through

educational programs or fines, when necessary. The SCAQMD is directly responsible for reducing emissions from stationary, mobile, and indirect sources. It has responded to this requirement by preparing a sequence of AQMPs. A revised draft of the 2012 AQMP was released on September, 2012, and was adopted by the SCAQMD Board on December 7, 2012. The 2012 AQMP is now awaiting approval from CARB and the U.S. EPA. The 2012 AQMP is being prepared in order to meet the federal Clean Air Act requirement that all 24-hour PM<sub>2.5</sub> non-attainment areas prepare a SIP, which was required to be submitted to the U.S. EPA by December 14, 2012 and demonstrate attainment with the 24-hour PM<sub>2.5</sub> standard by 2014. The 2012 AQMP demonstrates attainment of the federal 24-hour PM<sub>2.5</sub> standard by 2014 in the Basin through adoption of all feasible measures, and therefore, no extension of the attainment date is needed.

The 2007 AQMP demonstrated attainment with the 1997 8-hour ozone (80 ppb) standard by 2023, through implementation of future improvements in control techniques and technologies. These “black box” emissions reductions represent 65 percent of the remaining NO<sub>x</sub> emission reductions by 2023 in order to show attainment with the 1997 8-hour ozone NAAQS. Given the magnitude of these needed emissions reductions, additional NO<sub>x</sub> control measures have been provided in this AQMP even though the primary purpose of this AQMP is to show compliance with 24-hour PM<sub>2.5</sub> emissions standards.

The 2012 AQMP is designed to satisfy the California Clean Air Act’s (CCAA) emission reductions of 5 percent per year or adoption of all feasible measures requirements and fulfill the EPA’s requirement to update transportation conformity emissions budgets based on the latest approved motor vehicle emissions model and planning assumptions. The 2012 AQMP updates and revises the previous 2007 AQMP. The 2012 AQMP was prepared to comply with the Federal and State CCAA and amendments, to accommodate growth, to reduce the high pollutant levels in the Basin, to meet Federal and State ambient air quality standards, and to minimize the fiscal impact that pollution control measures have on the local economy. The purpose of the 2012 AQMP for the Basin is to set forth a comprehensive program that will lead this area into compliance with all federal and state air-quality planning requirements.

The 2012 AQMP builds upon the approaches taken in the 2007 AQMP for the attainment of federal PM and ozone standards, and highlights the significant amount of reductions needed and the need to engage in interagency coordinated planning of mobile sources to meet all of the federal criteria pollutant standards. Compared with the 2007 AQMP, the 2012 AQMP utilizes revised emissions inventory projections that use 2008 as the base year. On-road emissions are calculated using CARB EMFAC2011 emission factors and the transportation activity data provided by SCAG from their 2012 Regional Transportation Plan (2012 RTP). Off-road emissions were updated using CARB’s 2011 In-Use Off-Road Fleet Inventory Model. Since the 2007 AQMP was finalized new area source categories such as LPG transmission losses, storage tank and pipeline cleaning and degassing, and architectural colorants, were created and included in the emissions inventories. The 2012 AQMP also includes analysis of

several additional sources of GHG emissions such as landfills and could also assist in reaching the GHG target goals in the AB32 Scoping Plan.

The control measures in the 2012 AQMP consist of three components: 1) Basin-wide and episodic short-term PM<sub>2.5</sub> measures; 2) Section 182(e)(5) implementation measures; and 3) Transportation control measures. Many of the control measures are not based on command and control regulations, but instead focus on incentives, outreach, and education to bring about emissions reductions through voluntary participation and behavioral changes. More broadly, a transition to zero- and near-zero emission technologies is necessary to meet 2023 and 2032 air quality standards and 2050 climate goals. Many of the same technologies will address both air quality and climate needs.

During construction and operation, the project must comply with applicable rules and regulations. The following are rules the project may be required to comply with, either directly, or indirectly:

**SCAQMD Rule 402** prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

**SCAQMD Rule 403** governs emissions of fugitive dust during construction and operation activities. Compliance with this rule is achieved through application of standard Best Management Practices, such as application of water or chemical stabilizers to disturbed soils, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 miles per hour, sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph, and establishing a permanent ground cover on finished sites.

Rule 403 requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off-site. Applicable dust suppression techniques from Rule 403 are summarized below. Implementation of these dust suppression techniques can reduce the fugitive dust generation (and thus the PM<sub>10</sub> component). Compliance with these rules would reduce impacts on nearby sensitive receptors. Rule 403 measures may include but are not limited to the following:

- Apply nontoxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for 10 days or more).
- Water active sites at least three times daily. (Locations where grading is to occur will be thoroughly watered prior to earthmoving.)

- Cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meters (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicle Code section 23114.
- Reduce traffic speeds on all unpaved roads to 15 miles per hour (mph) or less.
- Suspension of all grading activities when wind speeds (including instantaneous wind gusts) exceed 25 mph.
- Bumper strips or similar best management practices shall be provided where vehicles enter and exit the construction site onto paved roads or wash off trucks and any equipment leaving the site each trip.
- Replanting disturbed areas as soon as practical.
- During all construction activities, construction contractors shall sweep on-site and off-site streets if silt is carried to adjacent public thoroughfares, to reduce the amount of particulate matter on public streets. All sweepers shall be compliant with SCAQMD Rule 1186.1, Less Polluting Sweepers.

**SCAQMD Rule 445** prohibits permanently installed wood burning devices into any new development. A wood burning device means any fireplace, wood burning heater, or pellet-fueled wood heater, or any similarly enclosed, permanently installed, indoor or outdoor device burning any solid fuel for aesthetic or space-heating purposes, which has a heat input of less than one million British thermal units per hour.

**SCAQMD Rule 481** applies to all spray painting and spray coating operations and equipment. The rule states that a person shall not use or operate any spray painting or spray coating equipment unless one of the following conditions is met:

- (1) The spray coating equipment is operated inside a control enclosure, which is approved by the Executive Officer. Any control enclosure for which an application for permit for new construction, alteration, or change of ownership or location is submitted after the date of adoption of this rule shall be exhausted only through filters at a design face velocity not less than 100 feet per minute nor greater than 300 feet per minute, or through a water wash system designed to be equally effective for the purpose of air pollution control.
- (2) Coatings are applied with high-volume low-pressure, electrostatic and/or airless spray equipment.
- (3) An alternative method of coating application or control is used which has effectiveness equal to or greater than the equipment specified in the rule.

**SCAQMD Rule 1108** governs the sale, use, and manufacturing of asphalt and limits the volatile organic compound (VOC) content in asphalt used in the South Coast Air Basin. This rule would regulate the VOC content of asphalt used during construction. Therefore, all asphalt used during construction of the project must comply with SCAQMD Rule 1108.

**SCAQMD Rule 1113** governs the sale, use, and manufacturing of architectural coating and limits the VOC content in paints and paint solvents. This rule regulates the VOC content of paints available during construction. Therefore, all paints and solvents used during construction and operation of the project must comply with SCAQMD Rule 1113.

**SCAQMD Rule 1143** governs the manufacture, sale, and use of paint thinners and solvents used in thinning of coating materials, cleaning of coating application equipment, and other solvent cleaning operations by limiting their VOC content. This rule regulates the VOC content of solvents used during construction. Solvents used during the construction phase must comply with this rule.

**SCAQMD Rule 1186** limits the presence of fugitive dust on paved and unpaved roads and sets certification protocols and requirements for street sweepers that are under contract to provide sweeping services to any federal, state, county, agency or special district such as water, air, sanitation, transit, or school district.

**SCAQMD Rule 1303** governs the permitting of re-located or new major emission sources, requiring Best Available Control Measures and setting significance limits for PM<sub>10</sub> among other pollutants.

**SCAQMD Rule 1401**, New Source Review of Toxic Air Contaminants, specifies limits for maximum individual cancer risk, cancer burden, and non-cancer acute and chronic hazard index from new permit units, relocations, or modifications to existing permit units, which emit toxic air contaminants.

**SCAQMD Rule 2202**, On-Road Motor Vehicle Mitigation Options, is to provide employers with a menu of options to reduce mobile source emissions generated from employee commutes, to comply with federal and state Clean Air Act requirements, Health & Safety Code Section 40458, and Section 182(d)(1)(B) of the federal Clean Air Act. It applies to any employer who employs 250 or more employees on a full or part-time basis at a worksite for a consecutive six-month period calculated as a monthly average.

In order to assist local agencies with direction on GHG emissions, the SCAQMD organized a working group and adopted Rules 2700, 2701, 2702, and 3002 which are described below.

#### **Rules 2700 and 2701**

The SCAQMD adopted Rules 2700 and 2701 on December 5, 2008, which establishes the administrative structure for a voluntary program designed to quantify GHG emission reductions. Rule 2701 provides specific protocols for private parties to follow

to generate certified GHG emission reductions for projects within the district. Approved protocols include forest projects, urban tree planting, and manure management. The SCAQMD is currently developing additional protocols for other reduction measures. For a GHG emission reduction project to qualify, it must be verified and certified by the SCAQMD Executive Officer, who has 60 days to approve or deny the Plan. Upon approval of the Plan, the Executive Officer issues required to issue a certified receipt of the GHG emission reductions within 90 days.

#### **Rule 2702**

The SCAQMD adopted Rule 2702 on February 6, 2009, which establishes a voluntary air quality investment program from which SCAQMD can collect funds from parties that desire certified GHG emission reductions, pool those funds, and use them to purchase or fund GHG emission reduction projects within two years, unless extended by the Governing Board. Priority will be given to projects that result in co-benefit emission reductions of GHG emissions and criteria or toxic air pollutants within environmental justice areas. Further, this voluntary program may compete with the cap-and-trade program identified for implementation in CARB's Scoping Plan, or a Federal cap and trade program.

#### **Rule 3002**

The SCAQMD amended Rule 3002 on November 5, 2010 to include facilities that emit greater than 100,000 tons per year of CO<sub>2</sub>e are required to apply for a Title V permit by July 1, 2011. A Title V permit is for facilities that are considered major sources of emissions.

Although the SCAQMD is responsible for regional air quality planning efforts, it does not have the authority to directly regulate air quality issues associated with plans and new development projects throughout the South Coast Air Basin. Instead, this is controlled through local jurisdictions in accordance to the California Environmental Quality Act (CEQA). In order to assist local jurisdictions with air quality compliance issues the CEQA Air Quality Handbook (SCAQMD CEQA Handbook), prepared by the SCAQMD, 1993, with the most current updates found at <http://www.aqmd.gov/ceqa/hdbk.html>, was developed in accordance with the projections and programs of the AQMP. The purpose of the SCAQMD CEQA Handbook is to assist Lead Agencies, as well as consultants, project proponents, and other interested parties in evaluating a proposed project's potential air quality impacts. Specifically, the SCAQMD CEQA Handbook explains the procedures that the SCAQMD recommends be followed for the environmental review process required by CEQA. The SCAQMD CEQA Handbook provides direction on how to evaluate potential air quality impacts, how to determine whether these impacts are significant, and how to mitigate these impacts. The SCAQMD intends that by providing this guidance, the air quality impacts of plans and development proposals will be analyzed accurately and consistently throughout the South Coast Air Basin, and adverse impacts will be minimized.

#### **SCAQMD Stakeholder Working Group**

Since neither CARB nor the OPR has developed GHG emissions threshold, the SCAQMD formed a Working Group to develop significance thresholds related to GHG emissions.

At the September 28, 2010 Working Group meeting, the SCAQMD released its most current version of the draft GHG emissions thresholds, which recommends a tiered approach that provides a quantitative annual thresholds of 10,000 MTCO<sub>2</sub>e for industrial uses.

*Southern California Association of Governments*

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino and Imperial Counties and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG is the Federally designated MPO for the majority of the southern California region and is the largest MPO in the nation. With respect to air quality planning, SCAG has prepared the Regional Transportation Plan and Regional Transportation Improvement Plan (RTIP), which addresses regional development and growth forecasts. These plans form the basis for the land use and transportation components of the AQMP, which are utilized in the preparation of air quality forecasts and in the consistency analysis included in the AQMP. The Regional Transportation Plan, Regional Transportation Improvement Plan, and AQMP are based on projections originating within the City and County General Plans.

5. Local – City of San Bernardino

Local jurisdictions, such as the City of San Bernardino, have the authority and responsibility to reduce air pollution through its police power and decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City is also responsible for the implementation of transportation control measures as outlined in the 2007 and 2012 AQMP. Examples of such measures include bus turnouts, energy-efficient streetlights, and synchronized traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation.

In accordance with the CEQA requirements, the City does not, however, have the expertise to develop plans, programs, procedures, and methodologies to ensure that air quality within the City and region will meet federal and state standards. Instead, the County relies on the expertise of the SCAQMD and utilizes the SCAQMD CEQA Handbook as the guidance document for the environmental review of plans and development proposals within its jurisdiction.

The Natural Resources and Conservation Element of the City of San Bernardino General Plan contains the following air quality-related goals and policies that are applicable to the proposed project:

Goal 12.5: Promote air quality that is compatible with the health, well-being, and enjoyment of life.

Policy 12.5.1: Reduce the emission of pollutants including carbon monoxide, oxides of nitrogen, photochemical smog, and sulfate in

accordance with South Coast Air Quality Management District (SCAQMD) standards.

Policy 12.5.2: Prohibit the development of land uses (e.g., heavy manufacturing) that will contribute significantly to air quality degradation, unless sufficient mitigation measures are undertaken according SCAQMD standards.

Policy 12.5.3: Require dust abatement measures during grading and construction operations.

Policy 12.5.4: Evaluate the air emissions of industrial land uses to ensure that they will not impact adjacent uses.

Goal 12.6: Reduce the amount of vehicular emissions in San Bernardino County.

Policy 12.6.1: Promote a pattern of land uses which locates residential uses in close proximity to employment and commercial services and provides, to the fullest extent possible, local job opportunities and commercial service to minimize vehicular travel and associated air emissions.

Policy 12.6.4: Facilitate the development of centralized parking lots and structures in commercial districts to promote walking between individual businesses in lieu of the use of automobiles. (LU-1)

Policy 12.6.5: Require qualifying development to implement or participate in transportation demand management programs, which provide incentives for car pooling, van pools, and the use of public transit and employ other trip reduction techniques (consistent with the Circulation Element and South Coast Air Quality Management Plan).

Policy 12.6.7: Promote the use of public transit and alternative travel modes to reduce air emissions.

Goal 12.7: Participate in regional initiatives and programs to improve the South Coast Basin's air quality.

Policy 12.7.1: Cooperate with the South Coast Air Quality Management District and incorporate pertinent local implementation provisions of the Air Quality Management Plan.

Policy 12.7.2: Work with the South Coast Air Quality Management District to establish controls and monitor uses in the City that could add to the air basin's degradation (e.g., auto repair, manufacturers).

- Policy 12.7.3: Coordinate with SCAQMD to ensure that all elements of air quality plans regarding reduction of air pollutant emissions are being enforced.
- Policy 12.7.4: Work with the other cities in the South Coast Air Basin to implement regional mechanisms to reduce air emissions and improve air quality.
- Policy 12.7.5: Support legislation that promotes cleaner industry, clean fuel vehicles, and more efficient burning engines and fuels.
- Policy 12.7.6: Encourage, publicly recognize, and reward innovative approaches to improve air quality.
- Policy 12.7.7: Involve environmental groups, the business community, special interests, and the general public in the formulation and implementation of programs that actively reduce airborne pollutants.

**B. Monitored Air Quality**

The air quality at any site is dependent on the regional air quality and local pollutant sources. Regional air quality is determined by the release of pollutants throughout the air basin. Estimates of the existing emissions in the Basin provided in the Revised Draft 2012 Air Quality Management Plan, prepared by SCAQMD, September 2012, indicate that collectively, mobile sources account for 59 percent of the VOC, 88 percent of the NOx emissions and 40 percent of directly emitted PM2.5, with another 10 percent of PM2.5 from road dust.

The SCAQMD has divided the South Coast Air Basin into 38 air-monitoring areas with a designated ambient air monitoring station representative of each area. The project site is located in source receptor area 34 (SRA 34), which is located in San Bernardino County and covers the area from just west of Fontana to Loma Linda. The nearest air monitoring station to the project site is the San Bernardino 4th Street Monitoring Station (San Bernardino Station). The San Bernardino Station is located approximately 2.02 miles northeast of the project site at 24302 East 4th Street, San Bernardino. Table 5 presents the monitored pollutant levels from the San Bernardino Station. However, it should be noted that due to the air monitoring station distance from the project site, recorded air pollution levels at the air monitoring station reflect with varying degrees of accuracy, local air quality conditions at the project site.

The monitoring data presented in Table 5 shows that ozone and particulate matter (PM10 and PM2.5) are the air pollutants of primary concern in the project area, which are detailed below. Where state and federal emissions are exceeded, the values have been bolded.

**Ozone**

During the 2012 to 2014 monitoring period, the State 1-hour concentration standard for ozone has been exceeded between 22 and 41 days each year at the San Bernardino Station.

The State 8-hour ozone standard has been exceeded between 53 and 77 days each year over the past three years at the San Bernardino Station. The Federal 8-hour ozone standard was exceeded between 36 and 54 days each year over the past five years at the San Bernardino Station.

Ozone is a secondary pollutant as it is not directly emitted. Ozone is the result of chemical reactions between other pollutants, most importantly hydrocarbons and NO<sub>2</sub>, which occur only in the presence of bright sunlight. Pollutants emitted from upwind cities react during transport downwind to produce the oxidant concentrations experienced in the area. Many areas of the SCAQMD contribute to the ozone levels experienced at the monitoring station, with the more significant areas being those directly upwind.

#### **Carbon Monoxide**

CO is another important pollutant that is due mainly to motor vehicles. The San Bernardino Station did not record an exceedance of the state or federal 1-hour or 8-hour CO standards for the last five years.

#### **Nitrogen Dioxide**

The San Bernardino Station did not record an exceedance of the State or Federal NO<sub>2</sub> standards for the last three years.

#### **Particulate Matter**

The State 24-hour concentration standards for PM<sub>10</sub> have been exceeded between one and two days each year over the past three years at the San Bernardino Station. Over the past three years the Federal 24-hour standard for PM<sub>10</sub> has only been exceeded for one day in 2013 and one day in 2014 at the San Bernardino Station.

The Federal 24 hour standard for PM<sub>2.5</sub> was exceeded one day in 2013 and one day in 2014 over the past three years at the San Bernardino Station. There does not appear to be a noticeable trend for PM<sub>10</sub> or PM<sub>2.5</sub> in either maximum particulate concentrations or days of exceedances in the area. Particulate levels in the area are due to natural sources, grading operations, and motor vehicles.

According to the EPA, some people are much more sensitive than others to breathing fine particles (PM<sub>10</sub> and PM<sub>2.5</sub>). People with influenza, chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death due to breathing these fine particles. People with bronchitis can expect aggravated symptoms from breathing in fine particles. Children may experience decline in lung function due to breathing in PM<sub>10</sub> and PM<sub>2.5</sub>. Other groups considered sensitive are smokers and people who cannot breathe well through their noses. Exercising athletes are also considered sensitive, because many breathe through their mouths during exercise.

**Table 3**

**State and Federal Criteria Pollutant Standards**

| Air Pollutant                                     | Concentration / Averaging Time  |   | Most Relevant Effects  |
|---|---|---|--|
|   | California Standards  | Federal Primary Standards                                     |  |
| Ozone (O <sub>3</sub> )                           | 0.09 ppm/1-hour<br>0.07 ppm/8-hour  | 0.075 ppm/8-hour  | (a) Pulmonary function decrements and localized lung edema in humans and animals; (b) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (c) Increased mortality risk; (d) Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (e) Vegetation damage; (f) Property damage. |
| Carbon Monoxide (CO)                              | 20.0 ppm/1-hour<br>9.0 ppm/8-hour   | 35.0 ppm/1-hour<br>9.0 ppm/8-hour                             | (a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) Impairment of central nervous system functions; (d) Possible increased risk to fetuses.   |
| Nitrogen Dioxide (NO <sub>2</sub> )               | 0.18 ppm/1-hour<br>0.03 ppm/annual  | 0.053 ppm/annual  | (a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; (c) Contribution to atmospheric discoloration.  |
| Sulfur Dioxide (SO <sub>2</sub> )                 | 0.25 ppm/1-hour<br>0.04 ppm/24-hour   | 75 ppb/1-hour<br>0.14 ppm/24-hour                             | (a) Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma.  |
| Suspended Particulate Matter (PM <sub>10</sub> )  | 50 µg/m <sup>3</sup> /24-hour<br>20 µg/m <sup>3</sup> /annual   | 150 µg/m <sup>3</sup> /24-hour                                | (a) Exacerbation of symptoms in sensitive patients with respiratory or cardiovascular disease; (b) Declines in pulmonary function growth in children; (c) Increased risk of premature death from heart or lung diseases in elderly.  |
| Suspended Particulate Matter (PM <sub>2.5</sub> ) | 12 µg/m <sup>3</sup> / annual   | 35 µg/m <sup>3</sup> /24-hour<br>12 µg/m <sup>3</sup> /annual |  |
| Sulfates  | 25 µg/m <sup>3</sup> /24-hour   | No Federal Standards  | (a) Decrease in ventilatory function; (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease; (d) Vegetation damage; (e) Degradation of visibility; (f) property damage.   |
| Lead  | 1.5 µg/m <sup>3</sup> /30-day   | 1.5 µg/m <sup>3</sup> / calendar quarter                      | (a) Learning disabilities; (b) Impairment of blood formation and nerve conduction.   |
| Visibility Reducing Particles                     | Extinction coefficient of 0.23 per kilometer-visibility of 10 miles or more due to particles when humidity is less than 70 percent. | No Federal Standards  | Visibility impairment on days when relative humidity is less than 70 percent.  |

<sup>1</sup> Obtained from Draft 2012 AQMP, SCAQMD, 2012. EPA often only declares Nonattainment areas; everywhere else is listed as Unclassified/Attainment or Unclassifiable.

<sup>2</sup> A design value below the NAAQS for data through the full year or smog season prior to the attainment date is typically required for attainment demonstration.

<sup>3</sup> Obtained from <http://www.arb.ca.gov/desig/adm/adm.htm>.

<sup>4</sup> 1-hour O<sub>3</sub> standard (0.13 ppm) was revoked, effective June 15, 2005; however, the Basin has not attained this standard based on 2008-2010 data has some continuing obligations under the former standard.

<sup>5</sup> 1997 8-hour O<sub>3</sub> standard (0.08 ppm) was reduced (0.075 ppm), effective May 27, 2008; the 1997 O<sub>3</sub> standard and most related implementation rules remain in place until the 1997 standard is revoked by U.S. EPA.

<sup>6</sup> New NO<sub>2</sub> 1-hour standard, effective August 2, 2010; attainment designations January 20, 2012; annual NO<sub>2</sub> standard retained.

<sup>7</sup> The 1971 annual and 24-hour SO<sub>2</sub> standards were revoked, effective August 23, 2010; however, these 1971 standards will remain in effect until one year after U.S. EPA promulgates area designations for the 2010 SO<sub>2</sub> 1-hour standard. Area designations expected in 2012, with SSAB designated Unclassifiable/Attainment.

<sup>8</sup> Annual PM10 standard was revoked, effective December 18, 2006; redesignation request to Attainment of the 24-hour PM10 standard is pending with U.S. EPA

<sup>9</sup> Partial Nonattainment designation - Los Angeles County portion of Basin only.

## V. AIR QUALITY STANDARDS

---

---

### A. Regional Air Quality

Many air quality impacts that derive from dispersed mobile sources, which are the dominate pollution generators in the basin, often occurs hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants such as ozone. The incremental regional air quality impact of an individual project is generally very small and difficult to measure. Therefore, the SCAQMD has developed significance thresholds based on the volume of pollution emitted rather than on actual ambient air quality because the direct air quality impact of a project is not quantifiable on a regional scale. The SCAQMD CEQA Handbook states that any project in the South Coast Air Basin with daily emissions that exceed any of the identified significance thresholds should be considered as having an individually and cumulatively significant air quality impact. For the purposes to this air quality impact analysis, a regional air quality impact would be considered significant if emissions exceed the SCAQMD significance thresholds identified in Table 6.

### B. Local Air Quality

Project-related construction air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. In order to assess local air quality impacts the SCAQMD has developed Localized Significant Thresholds (LSTs) to assess the project-related air emissions in the project vicinity. The SCAQMD has also provided Final Localized Significant Threshold Methodology (LST Methodology), June 2003, which details the methodology to analyze local air emission impacts. The Localized Significant Threshold Methodology found that the primary emissions of concern are NO<sub>2</sub>, CO, PM10, and PM2.5.

The significance thresholds for the local emissions of NO<sub>2</sub> and CO are determined by subtracting the highest background concentration from the last three years of these pollutants from Table 5 above, from the most restrictive ambient air quality standards for these pollutants that are outlined in the Localized Significant Thresholds. Table 6 shows the Localized Significant Thresholds for NO<sub>2</sub>, CO, and PM10 and PM2.5 as well as the ambient significance concentrations.

### C. Toxic Air Contaminants

According to the SCAQMD CEQA Handbook, any project that has the potential to expose the public to toxic air contaminants in excess of the following thresholds would be considered to have a significant air quality impact:

- If the Maximum Incremental Cancer Risk is 10 in one million or greater; or
- Toxic air contaminants from the proposed project would result in a Hazard Index increase of 1 or greater.

In order to determine if the proposed project may have a significant impact related to hazardous air pollutants (HAP), the Health Risk Assessment Guidance for analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, (Diesel Analysis), prepared by SCAQMD, August 2003, recommends that if the proposed project is anticipated to create hazardous air pollutants through stationary sources or regular operations of diesel trucks on the project site, then the proximity of the nearest receptors to the source of the hazardous air pollutants and the toxicity of the hazardous air pollutants should be analyzed through a comprehensive facility-wide health risk assessment (HRA).

**D. Odor Impacts**

The SCAQMD CEQA Handbook states that an odor impact would occur if the proposed project creates an odor nuisance pursuant to SCAQMD Rule 402, which states:

“A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

The provisions of this rule shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals”.

If the proposed project results in a violation of Rule 402 with regards to odor impacts, then the proposed project would create a significant odor impact.

**E. Greenhouse Gases**

1. Regional - South Coast Air Quality Management District

The project is within the South Coast Air Basin, which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD).

**SCAQMD Regulation XXVII, Climate Change.** SCAQMD Regulation XXVII currently includes three rules:

- The purpose of Rule 2700 is to define terms and post global warming potentials.
- The purpose of Rule 2701, SoCal Climate Solutions Exchange, is to establish a voluntary program to encourage, quantify, and certify voluntary, high quality certified greenhouse gas emission reductions in the SCAQMD.
- Rule 2702, Greenhouse Gas Reduction Program, was adopted on February 6, 2009. The purpose of this rule is to create a Greenhouse Gas Reduction Program for greenhouse gas emission reductions in the SCAQMD. The SCAQMD will fund projects through contracts in response to requests for proposals or purchase reductions from other parties.

A variety of agencies have developed greenhouse gas emission thresholds and/or have made recommendations for how to identify a threshold. However, the thresholds for projects in the jurisdiction of the SCAQMD remain in flux. The California Air Pollution Control Officers Association explored a variety of threshold approaches, but did not recommend one approach (2008). The ARB recommended approaches for setting interim significance thresholds (California Air Resources Board 2008b), in which a draft industrial project threshold suggests that non-transportation related emissions under 7,000 MTCO<sub>2e</sub> per year would be less than significant; however, the ARB has not approved those thresholds and has not published anything since then. The Bay Area Air Quality Management District and the San Joaquin Valley Air Pollution Control District have both developed greenhouse gas thresholds. However, those thresholds are not applicable to the project since the project is under the jurisdiction of the SCAQMD. The SCAQMD is in the process of developing thresholds, as discussed below.

**SCAQMD Threshold Development.** On December 5, 2008, the SCAQMD Governing Board adopted an interim greenhouse gas significance threshold for stationary sources, rules, and plans where the SCAQMD is lead agency (SCAQMD permit threshold). The SCAQMD permit threshold consists of five tiers. However, the SCAQMD is not the lead agency for this project. Therefore, the five permit threshold tiers do not apply to the proposed project.

The SCAQMD is in the process of preparing recommended significance thresholds for greenhouse gases for local lead agency consideration (“SCAQMD draft local agency threshold”); however, the SCAQMD Board has not approved the thresholds as of the date of the Notice of Preparation. The current draft thresholds consist of the following tiered approach:

- Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA.
- Tier 2 consists of determining whether the project is consistent with a greenhouse gas reduction plan. If a project is consistent with a qualifying local greenhouse gas reduction plan, it does not have significant greenhouse gas emissions.
- Tier 3 consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project’s construction emissions are averaged over 30 years and are added to a project’s operational emissions. If a project’s emissions are under one of the following screening thresholds, then the project is less than significant:
  - All land use types: 3,000 MTCO<sub>2e</sub> per year
  - Based on land use type: residential: 3,500 MTCO<sub>2e</sub> per year; commercial: 1,400 MTCO<sub>2e</sub> per year; or mixed use: 3,000 MTCO<sub>2e</sub> per year.
  - Based on land type: Industrial (where SCAQMD is the lead agency), 10,000 MTCO<sub>2e</sub> per year.
- Tier 4 has the following options:
  - Option 1: Reduce emissions from business as usual (BAU) by a certain percentage; this percentage is currently undefined (Riverside County Draft

CAP calls for a community-wide reduction of 25% from 2011 BAU emissions by 2020).

- Option 2: Early implementation of applicable AB 32 Scoping Plan measures.
- Option 3, 2020 target for service populations (SP), which includes residents and employees: 4.8 MTCO<sub>2</sub>e/SP/year for projects and 6.6 MTCO<sub>2</sub>e/SP/year for plans;
- Option 3, 2035 target: 3.0 MTCO<sub>2</sub>e/SP/year for projects and 4.1 MTCO<sub>2</sub>e/SP/year for plans.
- Tier 5 involves mitigation offsets to achieve target significance threshold.

The SCAQMD's draft threshold uses the Executive Order S-3-05 goal as the basis for the Tier 3 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap carbon dioxide concentrations at 450 ppm, thus stabilizing global climate. Specifically, the Tier 3 screening level for stationary sources is based on an emission capture rate of 90 percent for all new or modified projects. A 90 percent emission capture rate means that 90 percent of total emissions from all new or modified stationary source projects would be subject to a CEQA analysis, including a negative declaration, a mitigated negative declaration, or an environmental impact report, which includes analyzing feasible alternatives and imposing feasible mitigation measures. A GHG significance threshold based on a 90 percent emission capture rate may be more appropriate to address the long-term adverse impacts associated with global climate change because most projects will be required to implement GHG reduction measures. Further, a 90 percent emission capture rate sets the emission threshold low enough to capture a substantial fraction of future stationary source projects that will be constructed to accommodate future statewide population and economic growth, while setting the emission threshold high enough to exclude small projects that will in aggregate contribute a relatively small fraction of the cumulative statewide GHG emissions. This assertion is based on the fact that staff estimates that these GHG emissions would account for slightly less than one percent of future 2050 statewide GHG emissions target (85 MMTCO<sub>2</sub>e/yr). In addition, these small projects may be subject to future applicable GHG control regulations that would further reduce their overall future contribution to the statewide GHG inventory. Finally, these small sources are already subject to BACT for criteria pollutants and are more likely to be single-permit facilities, so they are more likely to have few opportunities readily available to reduce GHG emissions from other parts of their facility.

The SCAQMD has adopted a quantitative annual threshold of 10,000 MTCO<sub>2</sub>e for industrial uses. To be conservative, this project's emissions have been compared to both the draft screening threshold of 3,000 MTCO<sub>2</sub>e per year and the industrial threshold of 10,000 MTCO<sub>2</sub>e. Therefore, the SCAQMD's GHG emission thresholds are applicable to the proposed project and have been used as the threshold of significance.

## 2. Local - City of San Bernardino

The City of San Bernardino is a participating member of the San Bernardino Associated Governments (SANBAG) San Bernardino County Regional Greenhouse Gas

Reduction Plan. The City of San Bernardino is one of the 21 Partnership Cities of San Bernardino County and the Partnership has committed to actions that will reduce GHG emissions associated with its regional (or Countywide) activities as a whole. The 21 Partnership cities participating in the SANBAG San Bernardino County Regional Greenhouse Gas Reduction Plan are Adelanto, Big Bear Lake, Chino, Chino Hills, Colton, Fontana, Grand Terrace, Hesperia, Highland, Loma Linda, Montclair, Needles, Ontario, Rancho Cucamonga, Redlands, Rialto, San Bernardino, Twentynine Palms, Victorville, Yucaipa, and Yucca Valley. By working in a collaborative manner on these goals, the cities aim to more effectively address emissions from activities that are affected or influenced by the region as a whole.

According to 3.18 City of San Bernardino Chapter, of the SANBAG San Bernardino County Regional Greenhouse Gas Reduction Plan (2014). The City of San Bernardino selected a goal to reduce its community GHG emissions to a level that is 15% below its 2008 GHG emissions level by 2020. The City will meet and exceed this goal subject to reduction measures that are technologically feasible and cost-effective per AB 32 through a combination of state (~86%) and local (~14%) efforts. The City actually exceeds the goal with only state/county level actions (104% of goal), but has committed to several additional local measures.

The City of San Bernardino's Sustainability Master Plan Task Force, appointed by the City Council, is recommending various draft strategies for the Mayor and Common Council to consider adopting. This framework of strategies is located within the Land Use and Transportation section of the Draft Sustainable Master Plan (SMP). If adopted, the Draft SMP will support the goals of SB 375 and the Sustainable Communities Strategy through a wide range of actions. The Draft SMP will include GHG reduction measures similar to, but different from, the measures listed in the Plan. The Draft SMP measures will generally be more specific to the City of San Bernardino, but they will also support the goals of AB 32. The SMP follows the organization of the SANBAG San Bernardino County GHG Reduction Plan, with the SMP measures following the SANBAG San Bernardino County GHG Reduction Plan measures. For consistency with the County-level plan, estimates of GHG emission reductions identified in the SMP were obtained using the regional quantification tool.

The Pavley vehicle standards, the state's low carbon fuel standard, the RPS, and other state measures will reduce GHG emissions in San Bernardino's on-road, solid waste, and building energy sectors in 2020. An additional reduction of 72,138 MTCO<sub>2e</sub> will be achieved primarily through the following local measures, in order of importance: GHG Performance Standard for New Development; Energy Efficiency for Existing Buildings; and Implementation of the Sustainable Communities Strategy. San Bernardino's Plan has the greatest impacts on GHG emissions in the solid waste management, on-road transportation, and building energy sectors.

**Threshold for this project.** If the project's emissions exceed the SCAQMD's and GHG Reduction Plan's screening threshold of 3,000 MTCO<sub>2e</sub> per year for all land use projects, then the project's year 2020 emissions will be compared to the project's baseline GHG emissions.

**Table 6**

**SCAQMD Air Quality Significance Thresholds<sup>1</sup>**

| Mass Daily Thresholds                                 |  |                        |
|---|--|------------------------|

## VI. SHORT-TERM CONSTRUCTION-RELATED AIR QUALITY IMPACTS

---

---

Construction activities associated with the proposed project would have the potential to generate air emissions, toxic air contaminant emissions, and odor impacts. Assumptions for the phasing, duration, and required equipment for the construction of the proposed project were obtained from the project applicant. The construction activities for the proposed project are anticipated to include: site demolition of approximately 16,332 square feet, grading of 25.25 acres, construction of 564,652 square feet of building space and 103,585 square feet of landscaping, paving of 5.84 acres of on-site roads and a 452-space parking lot, and application of architectural coatings. The project will be constructed in one phase. The construction of the project is expected to begin June 2016 and be completed in March 2017. The project will be operational in 2017

### A. Construction-Related Regional Impacts

The construction-related regional air quality impacts have been analyzed for both criteria pollutants and GHGs.

#### 1. Construction-Related Criteria Pollutants Analysis

The following provides a discussion of the methodology used to calculate regional construction air emissions and an analysis of the proposed project's short-term construction emissions for the criteria pollutants.

##### *Methodology*

Typical emission rates from construction activities were obtained from CalEEMod Version 2013.2.2 CalEEMod is a computer model published by the SCAQMD for estimating air pollutant emissions. The CalEEMod program uses the EMFAC2011 computer program to calculate the emission rates specific for the western portion of San Bernardino County for construction-related employee vehicle trips and the OFFROAD2011 computer program to calculate emission rates for heavy truck operations. EMFAC2011 and OFFROAD2011 are computer programs generated by CARB that calculates composite emission rates for vehicles. Emission rates are reported by the program in grams per trip and grams per mile or grams per running hour. Using CalEEMod, the peak daily air pollutant emissions during each phase was calculated and presented below. These emissions represent the highest level of emissions for each of the construction phases in terms of air pollutant emissions. The construction emissions printouts from CalEEMod are provided in Appendix B.

The Project will be required to comply with existing SCAQMD rules for the reduction of fugitive dust emissions. SCAQMD Rule 403 establishes these procedures. Compliance with this rule is achieved through application of standard best management practices in construction and operation activities, such as application of water or chemical stabilizers to disturbed soils, managing haul road dust by application of water, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 mph, sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph and establishing a permanent, stabilizing ground cover on

finished sites. In addition, projects that disturb 50 acres or more of soil or move 5,000 cubic yards of materials per day are required to submit a Fugitive Dust Control Plan or a Large Operation Notification Form to SCAQMD. Based on the size of the Project area (approximately 25.25 acres) a Fugitive Dust Control Plan or Large Operation Notification would not be required.

SCAQMD's Rule 403 minimum requirements require that the application of the best available dust control measures are used for all grading operations and include the application of water or other soil stabilizers in sufficient quantity to prevent the generation of visible dust plumes. Compliance with Rule 403 would require the use of water trucks during all phases where earth moving operations would occur. Compliance with Rule 403 is required.

The phases of the construction activities which have been analyzed below are: 1) grading, 2) building construction, 3) paving, and 4) application of architectural coatings. For details on construction modeling, please see Appendix B.

The application of architectural coatings would occur after the completion of the construction phase. Per SCAQMD Rule 1113 as amended on June 3, 2011, the architectural coatings applied after January 1, 2014 will be limited to an average of 50 grams per liter or less and the CalEEMod model default VOC emissions have been adjusted accordingly. The architectural coating phase was modeled based on the CalEEMod-based calculation of the exterior area of 308,227 square feet and 846,978 square feet<sup>2</sup> for the interior. The exterior amount also includes 25,901 square feet of painting for the parking lot (approximately 6 percent of the paved area). According to the site plan, the concrete tilt-up panels will be pre-coated. Therefore, the emissions modeled by CalEEMod are likely an over-estimation VOC emissions.

#### *Project Impacts*

The construction-related criteria pollutant emissions for each phase are shown below in Table 7. Table 7 shows that none of the analyzed criteria pollutants would exceed the regional emissions thresholds. Therefore, a less than significant regional air quality impact would occur from construction of the proposed project.

### **B. Construction-Related Local Impacts**

Construction-related air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. The proposed project has been analyzed for the potential local air quality impacts created from: construction-related fugitive dust and diesel emissions; from toxic air contaminants; and from construction-related odor impacts.

---

<sup>2</sup> Interior area to be painted (SF) = (building square footage x 2) x 0.75  
Exterior to be painted (SF) = (building square footage x 2) x 0.25

1. Local Air Quality Impacts from Construction

The SCAQMD has published a “Fact Sheet for Applying CalEEMod to Localized Significance Thresholds” (South Coast Air Quality Management District 2011b). CalEEMod calculates construction emissions based on the number of equipment hours and the maximum daily disturbance activity possible for each piece of equipment. In order to compare CalEEMod reported emissions against the localized significance threshold lookup tables, the CEQA document should contain in its project design features or its mitigation measures the following parameters:

- 1) The off-road equipment list (including type of equipment, horsepower, and hours of operation) assumed for the day of construction activity with maximum emissions.
- 2) The maximum number of acres disturbed on the peak day.
- 3) Any emission control devices added onto off-road equipment.
- 4) Specific dust suppression techniques used on the day of construction activity with maximum emissions.

The CalEEMod output sheets included in Appendix B show the equipment used for this analysis.

As shown in Table 8, the maximum number of acres disturbed in a day would be five acres during grading.

The local air quality emissions from construction were analyzed using the SCAQMD’s Mass Rate Localized Significant Threshold Look-up Tables and the methodology described in Localized Significance Threshold Methodology, prepared by SCAQMD, revised July 2008. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily emissions of CO, NOx, PM10, and PM2.5 from the proposed project could result in a significant impact to the local air quality. The emission thresholds were calculated based on the Central San Bernardino Valley source receptor area (SRA 34) and a disturbance of five acres per day at the closest distance, 25 meters (82 feet), as the distance to the nearest sensitive receptors to the north of the site boundary is less than 25 meters. Table 9 shows the on-site emissions from the CalEEMod model for the different construction phases and the calculated emissions thresholds.

The data provided in Table 9 shows that none of the analyzed criteria pollutants would exceed the calculated local emissions thresholds at the nearest sensitive receptors. Therefore, a less than significant local air quality impact would occur from construction of the proposed project.

2. Construction-Related Toxic Air Contaminant Impacts

The greatest potential for toxic air contaminant emissions would be related to diesel particulate emissions associated with heavy equipment operations during construction of the proposed project. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of “individual cancer risk”.

“Individual Cancer Risk” is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. Given the relatively limited number of heavy-duty construction equipment and the short-term construction schedule, the proposed project would not result in a long-term (i.e., 70 years) substantial source of toxic air contaminant emissions and corresponding individual cancer risk. Therefore, no significant short-term toxic air contaminant impacts would occur during construction of the proposed project.

3. Construction-Related Odor Impacts

Potential sources that may emit odors during construction activities include the application of materials such as asphalt pavement. The objectionable odors that may be produced during the construction process are of short-term in nature and the odor emissions are expected cease upon the drying or hardening of the odor producing materials. Due to the short-term nature and limited amounts of odor producing materials being utilized, no significant impact related to odors would occur during construction of the proposed project.

**Table 7**  
**Construction-Related Regional Pollutant Emissions<sup>1</sup>**

| Activity                                       | Pollutant Emissions (pounds/day) |              |              |                 |              |             |
|--|----------------------------------|--------------|--------------|-----------------|--------------|-------------|
|  | VOC                              | NOx          | CO           | SO <sub>2</sub> | PM10         | PM2.5       |

<sup>2</sup> The estimated distance from the proposed grading activities to the nearest sensitive receptor (residences to the north of the project site) is less than 25 meters or 82 feet.

## VII. LONG-TERM OPERATIONAL AIR QUALITY IMPACTS

---

---

The on-going operation of the proposed project would result in a long-term increase in air quality emissions. This increase would be due to emissions from the project-generated vehicle trips and through operational emissions from the on-going use of the proposed project. The following section provides an analysis of potential long-term air quality impacts due to: regional air quality and local air quality impacts with the on-going operations of the proposed project.

### A. Operations-Related Regional Air Quality Impacts

The potential operations-related air emissions have been analyzed below for the criteria pollutants and cumulative impacts.

#### 1. Operations-Related Criteria Pollutant Analysis

The operations-related criteria air quality impacts created by the proposed project have been analyzed through use of the CalEEMod model. The operating emissions were based on the year 2017, which is the anticipated opening year for the proposed project. The operations daily emissions printouts from the CalEEMod model are provided in Appendix B. The CalEEMod analyzes operational emissions from area sources, energy usage, and mobile sources, which are discussed below.

#### **Mobiles Sources**

Mobile sources include emissions from the vehicle miles generated from the proposed project. The vehicle trips associated with the proposed project have been analyzed by inputting the project-generated vehicular trips from the Waterman Industrial Center Traffic Impact Analysis (TIA) (prepared by Kunzman Associates, Inc. September 9, 2015), into the CalEEMod Model. The Trip Generation Analysis found that the proposed project would create 755 automobile round trips, 33 2-axle truck round trips, 44 3-axle truck round trips, and 117 4+-axle truck round trips per day. The trip generation rate is 1.68 per thousand square feet. The program then applies the emission factors for each trip which is provided by the EMFAC2011 model to determine the vehicular traffic pollutant emissions. The vehicle mix was changed in CalEEMod to match the TIA (see Table 10). Due to the proposed project's location and proposed unrefrigerated warehouse land use, the average customer based trip length was increased to 40 miles, while all other trip lengths were based on the urban default values.

#### **Area Sources**

Area sources include emissions from consumer products, landscape equipment and architectural coatings. The area source emissions were based on the on-going use of the proposed 564,652 square feet of warehouse in the CalEEMod model. In order to account for SCAQMD Rule 1113, VOC content of paints was changed to 50g/L No other changes were made to the default area source parameters.

### **Energy Usage**

Energy usage includes emissions from the generation of electricity and natural gas used on-site. The energy usage emissions were based on the on-going use of the proposed 564,652 square feet of warehouse in the CalEEMod model. No changes were made to the default energy usage parameters. It should be noted that 2013 Title 24 commercial standards are 30 percent more efficient than 2008 Title 24 Standards (used as the baseline for emissions calculations in CalEEMod). However, no reduction credit was taken.

### *Project Impacts*

The worst-case summer or winter VOC, NO<sub>x</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions created from the proposed project's long-term operations have been calculated and are summarized below in Table 11. Table 11 shows that none of the analyzed criteria pollutants would exceed the regional emissions thresholds. Therefore, a less than significant regional air quality impact would occur from operation of the proposed project.

## 2. Cumulative Regional Air Quality Impacts

Cumulative projects include local development as well as general growth within the project area. However, as with most development, the greatest source of emissions is from mobile sources, which travel well out of the local area. Therefore, from an air quality standpoint, the cumulative analysis would extend beyond any local projects and when wind patterns are considered, would cover an even larger area. Accordingly, the cumulative analysis for the project's air quality must be generic by nature.

The project area is out of attainment for both ozone and PM<sub>10</sub> particulate matter. Construction and operation of cumulative projects will further degrade the local air quality, as well as the air quality of the South Coast Air Basin. The greatest cumulative impact on the quality of regional air cell will be the incremental addition of pollutants mainly from increased traffic from residential, commercial, and industrial development and the use of heavy equipment and trucks associated with the construction of these projects. Air quality will be temporarily degraded during construction activities that occur separately or simultaneously. However, in accordance with the SCAQMD methodology, projects that do not exceed the SCAQMD criteria or can be mitigated to less than criteria levels are not significant and do not add to the overall cumulative impact. With respect to long-term emissions, this project would create a less than significant cumulative impact.

## **B. Operations-Related Local Air Quality Impacts**

Project-related air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. The proposed project has been analyzed for the potential local CO emission impacts from the project-generated vehicular trips and from the potential local air quality impacts from on-site

operations. The following analysis analyzes the vehicular CO emissions, local impacts from on-site operations, and odor impacts.

1. Local CO Emission Impacts from Project-Generated Vehicular Trips

CO is the pollutant of major concern along roadways because the most notable source of CO is motor vehicles. For this reason, CO concentrations are usually indicative of the local air quality generated by a roadway network and are used as an indicator of potential local air quality impacts. Local air quality impacts can be assessed by comparing future without and with project CO levels to the State and Federal CO standards which were presented in above in Section V.

To determine if the proposed project could cause emission levels in excess of the CO standards discussed above in Section V, a sensitivity analysis is typically conducted to determine the potential for CO “hot spots” at a number of intersections in the general project vicinity. Because of reduced speeds and vehicle queuing, “hot spots” typically occur at high traffic volume intersections with a Level of Service E or worse.

The Traffic Analysis showed that the project would only generate a maximum of 949 trips. The intersection with the highest traffic volume is located at E Street and Orange Show Road and has a peak hour volume of 1,816 trips for the Year 2035 With Project AM peak hour scenario. The 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan) showed that an intersection which has a daily traffic volume of approximately 100,000 vehicles per day would not violate the CO standard. Therefore, as the intersection with the highest traffic volume falls far short of 100,000 vehicles, no CO “hot spot” modeling was performed and no significant long-term air quality impact is anticipated to local air quality with the on-going use of the proposed project.

2. Local Air Quality Impacts from On-Site Operations

Project-related air emissions from on-site sources such as architectural coatings, landscaping equipment, on-site usage of natural gas appliances as well as the operation of vehicles on-site may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. The nearest sensitive receptors that may be impacted by the proposed project are the residential dwelling units to the north and west of the boundaries of the project site.

The local air quality emissions from on-site operations were analyzed according to the methodology described in Localized Significance Threshold Methodology, prepared by SCAQMD, revised July 2008. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily emissions of CO, NOx, PM10, and PM2.5 from the proposed project could result in a significant impact to the local air quality. The proposed project was analyzed based on the Central San Bernardino Valley source receptor area and a five acre project site, which is the largest site available in the Look-up Tables and can be used as a screening analysis to determine whether more extension dispersion modeling is required. Table 12 shows the on-site emissions from

the CalEEMod model that includes natural gas usage, landscape maintenance equipment, and vehicles operating on-site and the calculated emissions thresholds. The data provided in Table 12 shows that the on-going operations of the proposed project would not exceed the local NO<sub>x</sub>, CO, PM<sub>10</sub> and PM<sub>2.5</sub> thresholds of significance discussed above in Section V. Therefore, the on-going operations of the proposed project would create a less than significant operations-related impact to local air quality due to on-site emissions and no mitigation would be required.

3. Operations-Related Odor Impacts

Potential sources that may emit odors during the on-going operations of the proposed project would include odor emissions from diesel truck emissions and trash storage areas. Due to the distance of the nearest receptors from the project site and through compliance with SCAQMD's Rule 402 no significant impact related to odors would occur during the on-going operations of the proposed project.

<sup>1</sup> Source: Calculated from CalEEMod and SCAQMD's Mass Rate Look-up Tables for five acres in Central San Bernardino Valley.

<sup>2</sup> Area sources consist of emissions from consumer products, architectural coatings, and landscaping equipment.

<sup>3</sup> Energy usage consists of emissions from generation of electricity and on-site natural gas usage.

<sup>4</sup> On-site vehicular emissions based on 1/10 of the gross vehicular emissions and road dust.

<sup>5</sup> The estimated distance from the proposed project to the nearest sensitive receptor (residences to the north of the project site) is less than 25 meters or 82 feet.

## VIII. DIESEL EMISSIONS HEALTH RISK ASSESSMENT

---

---

The on-going operation of the proposed project would generate toxic air contaminant emissions from diesel truck emissions created by the on-going operations of the proposed project. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology<sup>3</sup>.

A health risk assessment requires the completion and interaction of four general steps:

1. Quantify project-generated TAC emissions.
2. Identify nearby ground-level receptor locations that may be affected by the emissions (including any special sensitive receptor locations such as residences, schools, hospitals, convalescent homes, and daycare centers).
3. Perform air dispersion modeling analyses to estimate ambient pollutant concentrations at each receptor location using project TAC emissions and representative meteorological data to define the transport and dispersion of those emissions in the atmosphere.
4. Characterize and compare the calculated health risks with the applicable health risk significance thresholds.

### A. Emission Inventory Development

Important issues that affect the dispersion modeling include the following: 1) Model Selection, 2) Source Treatment, 3) Meteorological Data, and 4) Receptor Grid. Each of these issues is addressed below.

#### 1. Emission Source Estimates - DPM from Motor Vehicles

DPM emissions from the various sources were calculated using information derived from the project description, and mobile source emission factors from the CARB EMFAC2011 emissions factor model<sup>4</sup>. Truck mix information was obtained from the project-specific traffic report (Kunzman 2015).

---

<sup>3</sup> In February 2015, the Office of Environmental Health Hazard Assessment updated their "Air Toxics Hot Spots Program, Risk Assessments Guidelines, Guidance Manual for Preparation of Health Risk Assessments; however, the updated OEHHHA guidance states in the page footers "do not cite or quote." SCAQMD staff are still in the process of incorporating the updates into their methodology for SCAQMD's Rules 1401, 1401.1, 1402, and 212, and currently updating their HRA Guidance for permitting and CEQA analyses; therefore, the existing SCAQMD guidance was used to assess HRA impacts in this analysis. Per SCAQMD staff (personal communication with Dr. Jillian Wong 6-19-2015), updated SCAQMD HRA guidance will be forthcoming and use of current methodology and EMFAC2011 is acceptable.

<sup>4</sup> An emission factor is a representative value that attempts to relate the quantity of a pollutant released to the atmosphere with an activity associated with the release of that pollutant. These factors are usually expressed as the weight of pollutant divided by a unit of activity, volume, distance, or duration of the activity emitting the pollutant (e.g., grams of pollutant emitted per vehicle-mile traveled or grams of pollutant emitted per brake-horsepower).

Four pieces of information are required to generate the mobile source emissions from the proposed project:

- Number of vehicle trips for each component of the proposed project;
- Types of vehicles that access the proposed project (passenger car vs. heavy-duty truck and gasoline vs. diesel);
- The allocation of the vehicle trips to each building that comprises the proposed project; and
- Estimate of the vehicle emission factors for estimating exhaust and idling emissions.

#### *Estimate of Vehicle Trips and Vehicle Types*

The Kunzman Associates, Inc. project-specific traffic study (2015) showed the project is expected to generate approximately 949 vehicle trips per day.

The vehicle mix followed the recommendations of the Fontana Truck Trip Generation Study with a mix of 79.57 percent cars, 3.46 percent 2-axle trucks, 4.64 percent 3-axle trucks and 12.33 percent 4-axle trucks.

#### *Estimate of Emission Factors*

The DPM emission factors for the various vehicle types were derived from the CARB EMFAC2011 mobile source emission model. The 70-year average factors were derived for San Bernardino County for year 2017, the buildout year the proposed project. Emissions factors were estimated to establish the emissions generated while the vehicles travel off-site, along travel links from the entrance to the loading docks, and while idling at the loading dock during loading or unloading materials. All vehicles were assumed to travel on-site at a speed of 10 miles per hour. Off-site, the speeds along the roads were anticipated to average 35 miles per hour. Delivery vehicles were assumed to idle for a maximum of 15 minutes per vehicle per day (5 minutes per location: at the facility entrance, at the loading bay, and at the facility exit, in keeping with the CARB Air Toxic Control Measure (ATCM), which regulates truck idling time (CARB 2005). Table 13 provides the emission factors used in this assessment. It should be noted that the DPM emissions on both the gram per mile and gram per idle hour bases decline beyond 2015 for all vehicle classes and in particular the heavy-heavy-duty truck class (the 4+ axle “big rig” trucks). This is due to the CARB emissions’ requirements on heavy-duty trucks that call for either the replacement of older trucks with cleaner trucks or the installation of diesel particulate matter filters on the truck fleet.

#### *Emission Source Characterization*

Each of the emission source types described above also requires geometrical and emission release specifications for use in the air dispersion model. Table 14 provides a summary of the assumptions used to configure the various emission sources. The following definitions are used to characterize the emission source geometrical configurations referred to in Table 14:

Point source: A single, identifiable, local source of emissions; it is approximated in the AERMOD air dispersion model as a mathematical point in the modeling region with a

location and emission characteristics such as height of release, temperature, etc., for example, a truck idle location.

Line source: A series of volume sources along a path, for example, vehicular traffic along a roadway.

Figure 3 provides the location of the project buildings, emission source locations, and the locations of the adjacent sensitive receptors (located near the site's northern boundary [approximately 65 feet from the site] and to the west of the project (approximately 170 feet from the project's western boundary)). Commercial receptors are labeled com\_9, golf\_13, and golf\_14 and are located just north of the site and at the San Bernardino Public Golf Course to the south of the project site (adjacent to the project's southern boundary) respectively. The patrons of the Golf Course are treated like commercial receptors due to their relatively short time at the location (not 24-hours). Residential receptors are shown as orange triangles labeled 1 through 8, 10 through 12, 15 and 16.

**B. Receptor Network**

The assessment requires that a network of receptors be specified where the impacts can be computed at the various locations surrounding the project. Receptors were located at existing sensitive receptors surrounding the proposed project (as detailed above). In addition, the identified sensitive receptors locations were supplemented by the specification of a modeling grid that extended around the proposed project to identify other potential locations of impact. The locations of the receptors are shown as orange triangles on Figure 3.

**C. Dispersion Modeling**

The next step in the assessment process utilizes the emissions inventory along with a mathematical air dispersion model and representative meteorological data to calculate impacts at the various receptor locations. The dispersion model used in this assessment is described below.

1. Model Selection

The assessment of air quality and health risk impacts from pollutant emissions from this project applied the USEPA AERMOD Model, which is the air dispersion model accepted by the SCAQMD for performing air quality impact analyses. AERMOD predicts pollutant concentrations from point, area, volume, line, and flare sources with variable emissions in terrain from flat to complex with the inclusion of building downwash effects from buildings on pollutant dispersion. It captures the essential atmospheric physical processes and provides reasonable estimates over a wide range of meteorological conditions and modeling scenarios.

2. General Model Assumptions

A summary of Emission Configurations is shown in Table 14. The basic options used in the dispersion modeling are summarized in Table 15.

As indicated in Table 15, the analysis takes into account the effects of building downwash on the dispersion of emissions from the various sources located on the project's property. Building downwash occurs when the aerodynamic turbulence, induced by nearby buildings, causes pollutants emitted from an elevated source to be mixed rapidly toward the ground (downwash), resulting in potentially higher ground-level concentrations than if the buildings were not present. The AERMOD dispersion model contains algorithms to account for building downwash effects. The required information includes the location of the emission source; the location of adjacent buildings; and the building geometry in terms of length, width, and height. For purposes of this analysis, the emission source and building locations were taken from the project site plan. The building geometries were derived from the project plan, assuming a building height of 43 feet (as stated on the site plan) for the building.

### 3. Meteorological Data

Meteorological data from the Air District's San Bernardino monitoring site was selected for this modeling application. Five full years of sequential meteorological data was collected at the site from January 1, 2007 to December 31, 2011 by the SCAQMD. The SCAQMD processed the data for input to the model. The data was obtained at SCAQMD's <http://www.aqmd.gov/smog/metdata/AERMOD.html> (see Figure 4).

## D. Estimation of Health Risks

Health risks from diesel particulate matter are twofold. First, diesel particulate matter is a carcinogen according to the State of California. Second, long-term chronic exposure to diesel particulate matter can cause health effects to the respiratory system. Each of these health risks is discussed below.

### 1. Cancer Risks

According to the in Health Risk Assessment for Proposed Land Use Projects, prepared by CAPCOA, July 2009 and the SCAQMD Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality, the cancer risk should be calculated using the following formula:

$$[\text{Dose-inh (mg)/(Kg-day)}] * [\text{Oral Slope Factor (kg-day)/mg}] * [1 \times 10^6] = \text{Potential Cancer Risk}$$

Where:

Oral Slope Factor = 1.1

Dose-inh =  $(C_{\text{air}} * \text{DBR} * A * \text{EF} * \text{ED} * 10^{-6}) / \text{AT}$

Where:

$C_{\text{air}}$  [Concentration in air ( $\mu\text{g}/\text{m}^3$ )] = (Calculated by AERMOD Model)

DBR [Daily breathing rate (L/kg body weight – day)] = 302 for residential, 149 for off-site worker, and 581 for children

A [Inhalation absorption factor] = 1

EF [Exposure frequency (days/year)] = 350  
 ED [Exposure duration (years)] = 70 for residential, 40 for worker, and 9 for school child  
 $10^6$  [Micrograms to milligrams conversion]  
 AT [Average time period over which exposure is averaged in days] = 25,550

The Year 2017 model run results are shown below on Figure 5 and Appendix C. Table 16 provides a summary of the calculated diesel emission concentrations at the nearest sensitive receptors for the residential exposure scenario and Table 17 shows the Worker exposure scenario. There are no schools in the project vicinity. Table 16 shows that the highest residential cancer risks at any receptor location does not exceed a cancer risk increase of 3.39 per million people. As shown in Table 17, the highest risk to off-site workers does not exceed a cancer risk increase of 0.33 per million people. As shown on Figure 5, all off-site diesel emissions concentrations were found to be below the 10.0 in a million cancer risk threshold that has been discussed above in Section 2.0. Therefore, no significant long-term health impacts would occur to adjacent receptors from the operation of diesel trucks on the project site.

## 2. Non-Cancer Risks

The relationship for non-cancer health effects is given by the equation:

$$\text{HIDPM} = \text{CDPM}/\text{RELDPM}$$

Where,

HIDPM = Hazard Index; an expression of the potential for non-cancer health effects.  
 CDPM = Annual average diesel particulate matter concentration in  $\mu\text{g}/\text{m}^3$ .  
 RELDPM = Reference Exposure Level (REL) for diesel particulate matter; the diesel particulate matter concentration at which no adverse health effects are anticipated.

The non-carcinogenic hazards to residential and worker receptors are also detailed in Tables 16 and 17 respectively. The RELDPM is  $5 \mu\text{g}/\text{m}^3$ . The Office of Environmental Health Hazard Assessment as protective for the respiratory system has established this concentration. Using the maximum DPM concentration, the resulting Hazard Index is

$$\text{HIDPM} = 0.01429/5 = 0.0029$$

The criterion for significance is a Hazard Index increase of 1.0 or greater. Therefore, the on-going operations of the proposed project would result in a less than significant impact due to the non-cancer risk from diesel emissions created by the proposed project.

**Table 13**

**2017 DPM Emissions Factors for the Proposed Project (70-year average)<sup>1</sup>**

| Vehicle Class            | Idling (g/hr) | On-Site Travel (g/mi) | Off-Site Travel (g/mi) |

## IX. GLOBAL CLIMATE CHANGE ANALYSIS

---

---

The proposed project is anticipated to generate GHG emissions from area sources, energy usage, mobile sources, waste, water, and construction equipment. The following provides the methodology used to calculate the project-related GHG emissions, the project impacts and a consistency analysis of the proposed project with any applicable GHG reduction plans, policies or regulations.

### A. Methodology

The CalEEMod Version 2013.2.2 was used to calculate the GHG emissions from the proposed project. Through San Bernardino Associated Governments (SANBAG), the City of San Bernardino forms the San Bernardino Chapter of the San Bernardino County Regional GHG Reduction Plan. The Plan has been prepared to assist the City in conforming to the GHG emissions reductions as mandated under AB 32. Based on the CARB Scoping Plan, reducing GHG emissions to 1990 levels by 2020 means cutting approximately 30 percent from business-as-usual (BAU) emissions levels, or about 15 percent from year 2008 levels, which is the baseline year for the GHG Reduction Plan. Consistent with the CARB Scoping Plan, the City of San Bernardino has chosen a reduction target of 15 percent below 2008 GHG emissions levels by 2020. If the project exceeds the SCAQMD screening threshold of 3,000 MTCO<sub>2</sub>e per year for all land use types, then the project's year 2020 emissions will be compared to the project's baseline (BAU) GHG emissions.

The project's year 2017 (opening year) emissions were calculated, compared to the both the SCAQMD 3,000 MTCO<sub>2</sub>e per year screening threshold and the SCAQMD industrial threshold of 10,000 MTCO<sub>2</sub>e per year and the unmitigated results are shown in Table 18.

#### 1. Area Sources

Area sources include emissions from consumer products, landscape equipment and architectural coatings. Emissions from architectural coating reflect SCAQMD Rule 1113.

#### 2. Energy Usage

Energy usage includes emissions from the generation of electricity and natural gas used on-site. The energy usage was based on the CalEEMod defaults. No changes were made to the default energy usage parameters.

#### 3. Mobile Sources

Mobile sources were analyzed in the manner described in Section VII above.

4. Waste

Waste includes the GHG emissions generated from the processing of waste from the proposed project as well as the GHG emissions from the waste once it is interred into a landfill. The CalEEMod default values were used in the analysis.

5. Water

Water includes the water used for the interior of the building as well as for landscaping and is based on the GHG emissions associated with the energy used to transport and filter the water. The CalEEMod default values were used in the analysis.

6. Construction

The construction-related GHG emissions were also included in the analysis and were based on a 30 year amortization rate as recommended in the SCAQMD GHG Working Group meeting on November 19, 2009. The construction-related GHG emissions were calculated by CalEEMod and detailed above in Section VI.

**B. Project Greenhouse Gas Emissions**

The GHG emissions have been calculated based on the parameters described above. A summary of the results are shown below in Table 18 and the CalEEMod Model run for the proposed project is provided in Appendix D. Table 18 shows that without any mitigation, the proposed project would generate 3,918.41 MTCO<sub>2</sub>e per year. However, with mitigation (as detailed in Section XI, Mitigation Measures), the results in Table 19 show that the project would generate 2,913.97 MTCO<sub>2</sub>e per year. According to the thresholds of significance established above in Section 5.0, a cumulative global climate change impact would occur if the GHG emissions created from the on-going operations would exceed the 3,000 metric tons per year of CO<sub>2</sub>e SCAQMD and the SANBAG GHG Reduction Plan Screening threshold. The emissions were also compared the SCAQMD industrial project's threshold of 10,000 metric tons per year of CO<sub>2</sub>e. Therefore, with incorporation of mitigation, the operation of the proposed project would not create a significant cumulative impact to global climate change.

The project is also subject to the requirements of the California Green Building Standards Code. On January 12, 2010, the State Building Standards Commission unanimously adopted updates to the California Green Building Standards Code, which went into effect on January 1, 2011. The Code is a comprehensive and uniform regulatory code for all residential, commercial and school buildings.

The California Green Building Standards Code does not prevent a local jurisdiction from adopting a more stringent code as state law provides methods for local enhancements. The Code recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided they provide a minimum 50-percent diversion requirement. The code also provides exemptions for areas not served by construction and demolition recycling infrastructure. State building code

provides the minimum standard that buildings need to meet in order to be certified for occupancy. Enforcement is generally through the local building official.

The California Green Building Standards Code (code section in parentheses) requires:

- Water Efficiency and Conservation [Indoor Water Use (4.303.1)]. Fixtures and fixture fittings reducing the overall use of potable water within the building by at least 20 percent shall be provided. The 20 percent reduction shall be demonstrated by one of the following methods:
  - Prescriptive Method: Showerheads ( $\leq 2.0$  gpm @ 80 psi); Residential Lavatory Faucets ( $\leq 1.5$  gpm @ 60 psi); Nonresidential Lavatory Faucets ( $\leq .4$  gpm @ 60 psi); Kitchen Faucets ( $\leq 1.8$  gpm @ 60 psi); Toilets ( $\leq 1.28$  gal/flush); and urinals ( $\leq 0.5$  gal/flush).
  - Performance Method: Provide a calculation demonstrating a 20% reduction of indoor potable water using the baseline values set forth in Table 4.303.1. The calculation will be limited to the total water usage of showerheads, lavatory faucets, water closets and urinals within the dwelling.
- Water Efficiency and Conservation [Outdoor Water Use (4.304.1)]. Irrigation Controllers. Automatic irrigation system controllers for landscaping provided by the builder and installed at the time of final inspection shall comply with the following:
  - Controllers shall be weather- or soil moisture-based controllers that automatically adjust irrigation in response to changes in plants' watering needs as weather or soil conditions change.
  - Weather-based controllers without integral rain sensors or communication systems that account for rainfall shall have a separate wired or wireless rain sensor which connects or communicates with the controller(s).
- Construction Waste Reduction of at least 50 percent (4.408.1). Recycle and/or salvage for reuse a minimum of 50 percent of the nonhazardous construction and demolition waste in accordance with either Section 4.408.2, 4.408.3 or 4.408.4; OR meet a more stringent local construction and demolition waste management ordinance. Documentation is required per Section 4.408.5. Exceptions:
  - Excavated soil and land-clearing debris.
  - Alternate waste reduction methods developed by working with local enforcing agencies if diversion or recycle facilities capable of compliance with this item do not exist or are not located reasonably close to the jobsite.
  - The enforcing agency may make exceptions to the requirements of this section when jobsites are located in areas beyond the haul boundaries of the diversion facility.
- Materials pollution control (4.504.1 – 4.504.6). Low-pollutant emitting interior finish materials such as paints, carpet, vinyl flooring and particleboard.
- Installer and Special Inspector Qualifications (702.1-702.2). Mandatory special installer inspector qualifications for installation and inspection of energy systems (e.g., heat furnace, air conditioner, mechanical equipment).

Compliance with 2013 Title 24 Standards and Green Building Standards (CalGreen) is included as mitigation and will reduce project-related greenhouse emissions.

**C. Greenhouse Gas Plan Consistency**

The proposed project would have the potential to conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases. As stated previously, the City of San Bernardino is one of the 21 partnership cities that are participating in the San Bernardino Associated Governments (SANBAG) San Bernardino County Regional GHG Reduction Plan. Therefore, the applicable plan for the proposed project is the SANBAG San Bernardino County Regional GHG Reduction Plan. The City of San Bernardino forms the San Bernardino Chapter of the San Bernardino County Regional GHG Reduction Plan, released March 5, 2014. The Plan has been prepared to assist the City in conforming to the GHG emissions reductions as mandated under AB 32.

The City of San Bernardino also has a Sustainability Master Plan. The City of San Bernardino's Sustainability Master Plan Task Force, appointed by the City Council, is recommending various draft strategies for the Mayor and Common Council to consider adopting. This framework of strategies is located within the Land Use and Transportation section of the Draft Sustainable Master Plan (SMP). If adopted, the Draft SMP will support the goals of SB 375 and the Sustainable Communities Strategy through a wide range of actions. The Draft SMP will include GHG reduction measures similar to, but different from, the measures listed in the GHG Plan. The Draft SMP measures will generally be more specific to the City of San Bernardino, but they will also support the goals of AB 32. The SMP follows the organization of the SANBAG San Bernardino County GHG Reduction Plan, with the SMP measures following the County GHG Reduction Plan measures.

As stated previously, the SCAQMD's screening thresholds used Executive Order S-3-05 goal as the basis for deriving the screening level. The California Governor issued Executive Order S-3-05, GHG Emission, in June 2005, which established the following reduction targets:

- 2010: Reduce greenhouse gas emissions to 2000 levels
- 2020: Reduce greenhouse gas emissions to 1990 levels
- 2050: Reduce greenhouse gas emissions to 80 percent below 1990 levels.

In 2006, the California State Legislature adopted AB 32, the California Global Warming Solutions Act of 2006. AB 32 requires CARB, to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020 through an enforceable statewide emission cap which will be phased in starting in 2012.

Therefore, if the project's emissions meet the threshold for compliance (the 3,000 MTCO<sub>2</sub>e per year screening threshold) with Executive Order S-3-05, then the project's emissions also comply with the goals of AB 32; which is also the goal of the SANBAG GHG Reduction Plan and the SMP.

At a level of 2,913.97 MTCO<sub>2</sub>e per year with mitigation, the project's GHG emissions fall below the SCAQMD and SANBAG GHG Reduction Plan screening threshold of 3,000 metric tons per year of CO<sub>2</sub>e for all land uses, and well below the SCAQMD's GHG emissions threshold of 10,000 metric tons per year of CO<sub>2</sub>e for industrial projects. Furthermore, the project will comply with applicable Green Building Standards and City of San Bernardino's policies regarding sustainability (as dictated by the City's General Plan), further analysis is not warranted.

**Table 18**

**Unmitigated Project-Related Greenhouse Gas Emissions<sup>1</sup>**

| Category   | Greenhouse Gas Emissions (Metric Tons/Year) |                        |                 |                 |                  |                   |

## **X. AIR QUALITY COMPLIANCE**

---

---

The California Environmental Quality Act (CEQA) requires a discussion of any inconsistencies between a proposed project and applicable General Plans and Regional Plans (CEQA Guidelines Section 15125). The regional plan that applies to the proposed project includes the SCAQMD Air Quality Management Plan (AQMP). Therefore, this section discusses any potential inconsistencies of the proposed project with the AQMP.

The purpose of this discussion is to set forth the issues regarding consistency with the assumptions and objectives of the AQMP and discuss whether the proposed project would interfere with the region's ability to comply with Federal and State air quality standards. If the decision-makers determine that the proposed project is inconsistent, the lead agency may consider project modifications or inclusion of mitigation to eliminate the inconsistency.

The SCAQMD CEQA Handbook states that "New or amended General Plan Elements (including land use zoning and density amendments), Specific Plans, and significant projects must be analyzed for consistency with the AQMP". Strict consistency with all aspects of the plan is usually not required. A proposed project should be considered to be consistent with the AQMP if it furthers one or more policies and does not obstruct other policies. The SCAQMD CEQA Handbook identifies two key indicators of consistency:

- (1) Whether the project will result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.
- (2) Whether the project will exceed the assumptions in the AQMP in 2010 or increments based on the year of project buildout and phase.

Both of these criteria are evaluated in the following sections.

### **A. Criterion 1 - Increase in the Frequency or Severity of Violations**

Based on the air quality modeling analysis contained in this Air Analysis, short-term construction impacts will not result in significant impacts based on the SCAQMD regional and local thresholds of significance. This Air Analysis also found that long-term operations impacts will not result in significant impacts based on the SCAQMD local, regional, and toxic air contaminant thresholds of significance.

Therefore, the proposed project is not anticipated to contribute to the exceedance of any air pollutant concentration standards and is found to be consistent with the AQMP for the first criterion.

### **B. Criterion 2 - Exceed Assumptions in the AQMP?**

Consistency with the AQMP assumptions is determined by performing an analysis of the proposed project with the assumptions in the AQMP. The emphasis of this criterion is to

insure that the analyses conducted for the proposed project are based on the same forecasts as the AQMP. The Regional Comprehensive Plan and Guide (RCP&G) consists of three sections: Core Chapters, Ancillary Chapters, and Bridge Chapters. The Growth Management, Regional Mobility, Air Quality, Water Quality, and Hazardous Waste Management chapters constitute the Core Chapters of the document. These chapters currently respond directly to federal and state requirements placed on SCAG. Local governments are required to use these as the basis of their plans for purposes of consistency with applicable regional plans under CEQA. For this project, the City of San Bernardino General Plan defines the assumptions that are represented in the AQMP.

The City's General Plan land use designations for the project site are Industrial and Open Space. The City's zoning designation for the site includes: Industrial Light, Office Industrial Park, and Public Commercial Recreation. Therefore, the proposed project is not currently consistent with the land use or zoning designations. However, approval of the proposed project includes a General Plan Amendment (GPA) and a Zoning Map Amendment (ZMA) to change the General Plan land use designation to Industrial and the zoning designation to Industrial Light. With approval of the GPA and ZMA, the proposed project would be consistent with the land use and zoning designations and development standards for the project site.

With approval of the GPA and ZMA, the proposed project would be consistent with the land use and zoning designations and development standards for the project site. Therefore, once the proposed project is approved, the project would not result in an inconsistency with the land use designation. Therefore, the proposed would not be anticipated to exceed the AQMP assumptions for the project site and would be consistent with the AQMP for the second criterion.

Based on the above, the proposed project would not conflict with implementation of the AQMP, impacts are considered to be less than significant.

## **XI. MITIGATION MEASURES**

---

---

### **A. Construction Measures**

The project is required to comply with SCAQMD Rule 403 - Fugitive Dust. No construction mitigation is required.

### **B. Operational Measures**

Mitigation Measure 1. The project applicant shall provide sidewalks within the project boundary and along the off-site roadway improvements.

Mitigation Measure 2. The project applicant shall require that any future tenants institute a ride sharing program and employee vanpool/shuttle that is open to all employees.

Mitigation Measure 3. The project applicant shall require that all building structures meet or exceed 2013 Title 24 Standards and Green Building Code Standards.

Mitigation Measure 4. The project applicant shall require that all lighting installed in the proposed structures uses on average a minimum of 5 percent less energy than conventional metal halide warehouse lighting.

Mitigation Measure 5. The project applicant shall require that all faucets, toilets and showers installed in the proposed structures utilize low-flow fixtures that would reduce indoor water demand by 20% per CalGreen Standards.

Mitigation Measure 6. The project applicant shall require that ENERGY STAR-compliant appliances are installed on-site.

Mitigation Measure 7. The project applicant shall require all future tenants to institute recycling programs that reduces waste to landfills by a minimum of 50 percent (75 percent by 2020) and includes designated recycling bins at each proposed structure and requires all green waste to be processed at a recycling or composting facility.

**1.3 User Entered Comments & Non-Default Data**

Project Characteristics -

Land Use - Total site is 25.25 acres. Building 564,652 sf, gross landscaping 103,585 sf, parking lot including 281 warehouse & 171 trailer parking stalls = 452 parking stalls.

Construction Phase - As per developer, construction start 6/2016 and end 3/2017.

Demolition - Building square foot of 16,332 obtained from Google Earth.

Grading - Total site is 25.25 acres. As per developer, site to be balanced.

Architectural Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A interior 846,978 exterior 291,366 (including 5% of parking lot sf)

Vehicle Trips - Vehicle trips provided by TIA of 1.68 trips/TSF/day. Trip length increased to 40 miles for C-W (trucks) per SCAQMD recs. Trip % changed to 20.43 for C-W (trucks) and 79.57 C-NW for cars to match TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Area Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A 846,978 interior 291,366 exterior (including 5% of parking lot sf)

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation - Light industrial uses have 1030 sf/employee. Site is 0.14 miles to Omnitrans Route 9. Approximately 1.9 miles southeast of downtown San Bernardino.

Area Mitigation - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC.

Energy Mitigation - 2013 Title 24 commercial standards are 30% more efficient than 2008 standards. Project to install high efficiency lighting that reduces energy by 5% or more. Project will be LEED Silver. Energy Star appliances installed on-site.

Water Mitigation - 20% reduction in indoor water use and use of water efficient irrigation systems, per Green Building Standards.

Waste Mitigation - AB 939 requires each jurisdiction in California to divert at least 50 percent of its waste away from landfills.

Mobile Commute Mitigation - Passenger cars make up 79.57% of project-related traffic. All employees driving cars are eligible for vanpool/shuttle/ride share programs.

### 4.0 Operational Detail - Mobile

---

#### 4.1 Mitigation Measures Mobile

- Increase Density
- Improve Destination Accessibility
- Increase Transit Accessibility
- Improve Pedestrian Network
- Employee Vanpool/Shuttle
- Provide Ride Sharing Program

**1.3 User Entered Comments & Non-Default Data**

## Project Characteristics -

Land Use - Total site is 25.25 acres. Building 564,652 sf, gross landscaping 103,585 sf, parking lot including 281 warehouse & 171 trailer parking stalls = 452 parking stalls.

Construction Phase - As per developer, construction start 6/2016 and end 3/2017.

Demolition - Building square foot of 16,332 obtained from Google Earth.

Grading - Total site is 25.25 acres. As per developer, site to be balanced.

Architectural Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A interior 846,978 exterior 291,366 (including 5% of parking lot sf)

Vehicle Trips - Vehicle trips provided by TIA of 1.68 trips/TSF/day. Trip length increased to 40 miles for C-W (trucks) per SCAQMD recs. Trip % changed to 20.43 for C-W (trucks) and 79.57 C-NW for cars to match TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Area Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A 846,978 interior 291,366 exterior (including 5% of parking lot sf)

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation - Light industrial uses have 1030 sf/employee. Site is 0.14 miles to Omnitrans Route 9. Approximately 1.9 miles southeast of downtown San Bernardino.

Area Mitigation - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC.

Energy Mitigation - 2013 Title 24 commercial standards are 30% more efficient than 2008 standards. Project to install high efficiency lighting that reduces energy by 5% or more. Project will be LEED Silver. Energy Star appliances installed on-site.

Water Mitigation - 20% reduction in indoor water use and use of water efficient irrigation systems, per Green Building Standards.

Waste Mitigation - AB 939 requires each jurisdiction in California to divert at least 50 percent of its waste away from landfills.

Mobile Commute Mitigation - Passenger cars make up 79.57% of project-related traffic. All employees driving cars are eligible for vanpool/shuttle/ride share programs.

**APPENDIX C**

**AERMOD Model Printouts**

## Emission Assumptions

DPM

Emissions

Waterman

### Facility Operations

Buildout year:

2017

### Emission Factors

#### 1) Onsite Vehicle Emissions

##### a) Truck

##### (1) EMFAC2011

##### (a) Annual Meteorology

Temperature: 65 degF

Relative Humidity: 50%

##### (b) Calculations for SB County

##### (c) Truck Mix

4+ axle heavy-heavy duty diesel trucks (HHDT)

4 axle diesel trucks (MHDT)

2 axle diesel trucks (LHDT2)

(d) Onsite Truck Travel Speed: 10 mph

(e) Off-site Truck Travel Speed: 35 mph

(f) Idle speed: 0 mph

(g) Truck Idle time: 15 minutes per truck per day

#### 2) Other Parameters

(a) Width of Volume Source: 12 feet

(b) Truck Operational Schedule: 24 hours/day

***      MODEL SETUP OPTIONS SUMMARY      ***

```

```

-- -- -- -- --
**Model Is Setup For Calculation of Average CONCentration Values.

```

```

-- DEPOSITION LOGIC --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT = F
**Model Uses NO WET DEPLETION.  WETDPLT = F

```

```

**Model Uses URBAN Dispersion Algorithm for the SBL for 587 Source(s),
for Total of 1 Urban Area(s):
Urban Population = 219288.0 ; Urban Roughness Length = 1.000 m

```

```

**Model Allows User-Specified Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

```

```

**Other Options Specified:
FASTALL - Use effective sigma-y to optimize meander for
          POINT and VOLUME sources, and hybrid approach
          to optimize AREA sources (formerly TOXICS option)
TEMP_Sub - Meteorological data includes TEMP substitutions

```

```

**Model Assumes No FLAGPOLE Receptor Heights.

```

\*\*The User Specified a Pollutant Type of: DPM

\*\*Model Calculates ANNUAL Averages Only

\*\*This Run Includes: 587 Source(s); 1 Source Group(s); and 457 Receptor(s)

with: 6 POINT(s), including  
0 POINTCAP(s) and 0 POINTHOR(s)  
and: 581 VOLUME source(s)  
and: 0 AREA type source(s)  
and: 0 LINE source(s)  
and: 0 OPENPIT source(s)

\*\*Model Set To Continue RUNNING After the Setup Testing.

\*\*The AERMET Input Meteorological Data Version Date: 14134

\*\*Output Options Selected:

Model Outputs Tables of ANNUAL Averages by Receptor  
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)  
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

\*\*NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours  
m for Missing Hours  
b for Both Calm and Missing Hours

\*\*Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 305.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0  
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07  
Output Units = MICROGRAMS/M\*\*3

\*\*Approximate Storage Requirements of Model = 4.6 MB of RAM.

\*\*Detailed Error/Message File: 5629b Waterman.err  
\*\*File for Summary of Results: 5629b Waterman.sum

**1.3 User Entered Comments & Non-Default Data**

Project Characteristics -

Land Use - Total site is 25.25 acres. Building 564,652 sf, gross landscaping 103,585 sf, parking lot including 281 warehouse & 171 trailer parking stalls = 452 parking stalls.

Construction Phase - As per developer, construction start 6/2016 and end 3/2017.

Demolition - Building square foot of 16,332 obtained from Google Earth.

Grading - Total site is 25.25 acres. As per developer, site to be balanced.

Architectural Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A interior 846,978 exterior 291,366 (including 5% of parking lot sf)

Vehicle Trips - Vehicle trips provided by TIA of 1.68 trips/TSF/day. Trip length increased to 40 miles for C-W (trucks) per SCAQMD recs. Trip % changed to 20.43 for C-W (trucks) and 79.57 C-NW for cars to match TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Vehicle Emission Factors - Traffic Mix From TIA.

Area Coating - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC. Square footage calculated using CalEEMod Appendix A 846,978 interior 291,366 exterior (including 5% of parking lot sf)

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation - Light industrial uses have 1030 sf/employee. Site is 0.14 miles to Omnitrans Route 9. Approximately 1.9 miles southeast of downtown San Bernardino.

Area Mitigation - SCAQMD Rule 1113 limits all architectural coating to 50 g/L VOC.

Energy Mitigation - 2013 Title 24 commercial standards are 30% more efficient than 2008 standards. Project to install high efficiency lighting that reduces energy by 5% or more. Project will be LEED Silver. Energy Star appliances installed on-site.

Water Mitigation - 20% reduction in indoor water use and use of water efficient irrigation systems, per Green Building Standards.

Waste Mitigation - AB 939 requires each jurisdiction in California to divert at least 50 percent of its waste away from landfills.

Mobile Commute Mitigation - Passenger cars make up 79.57% of project-related traffic. All employees driving cars are eligible for vanpool/shuttle/ride share programs.

### Biological Constraints Analysis

December 1, 2015

Ms. Karina Fidler  
Kimley-Horn  
401 B Street, Suite 600  
San Diego, CA 92101

**Subject: Biological Constraints Report for Waterman Industrial Center, San Bernardino, California**

Ms. Fidler:

This letter report describes the results of a biological constraints survey that Rocks Biological Consulting (RBC) conducted at the Waterman Industrial Center Project site. This report discusses the potential biological constraints under the California Environmental Quality Act (CEQA) and applicable state and federal regulations.

#### **Project Location**

The site is located within an existing residential and developed area of the City of San Bernardino southwest of the intersection of E. Dumas St and S. Waterman Ave just north of San Bernardino Public Golf Course (Figure 1). The biological study area was approximately 36-acres, which included the 25.4-acre project site plus a 100-foot buffer. The site is located on United States Geological Survey (USGS) San Bernardino South 7.5' Topographic Map.

#### **Methods**

RBC began preparations for the biological constraints survey by creating field maps using Geographic Information System (GIS) and incorporating relevant data, including a color aerial photograph and the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDDB) information.

On October 21, 2015 RBC conducted a general biological survey for flora and fauna within the survey area and mapped vegetation communities/land uses within the project site and the immediately surrounding area. No focused surveys for plant or wildlife species or formal wetland delineation was conducted. Vegetation community classifications follow Holland (1986), plant names follow Rebman and Simpson (2014), and animal names follow CDFW (2015). The on-site survey was conducted in early fall during the morning in warm weather (63-70 F) with a slight breeze.

#### **Survey Results**

The site is located in a residential area and active golf course. The property is relatively flat and all land within the project area has previously been disturbed by human activities. There are no native habitats on site. Additionally, no drainages, riparian habitat, or aquatic features were observed during the site visit.

The project site supports the following vegetation types or land uses:

**Developed** – areas support no native vegetation and typically include human-made structures such as buildings or roads. Within the study area, developed areas occur primarily at the north end of the site and consist of single-family homes, churches, and roads. Included in the developed land use is the active public golf course that supports no native vegetation and generally consists of mowed non-native grass. The active golf course is present at the south end of the study site.

**Disturbed** – areas typically include land that has been previously disturbed by vegetation clearing, development, or agricultural activities. Areas mapped as disturbed include lands generally cleared of vegetation such that little or no natural habitat remains and lands disturbed such that, where vegetated, at least 50 percent of plant cover is non-native species. The disturbed lands on the site are dominated by puncture vine (*Tribulus terrestris*), London rocket (*Sisymbrium irio*), and Russian thistle (*Salsola australis*). Other plants that occur include castor bean (*Ricinus communis*), ripgut brome (*Bromus diandrus*), short-pod mustard (*Hirschfeldia incana*), alkali mallow (*Malvella leprosa*), and filaree species (*Erodium* spp.).

**Ornamental** – areas typically consist of non-native landscape and/or garden plantings that have been planted in association with development. San Bernardino County supports many ornamental trees, shrubs, and herbs that decorate urban areas. Ornamental species occur on the site in association with adjacent residential development, notably rows of planted and irrigated pine trees (*Pinus* sp.) and a patch of Chinese elm (*Ulmus parvifolia*).

Table 1 summarizes the extent of the vegetation types and land uses on the site.

Table 1. Vegetation Communities/Land Uses

| Vegetation/Land Use           | Acres in Project boundary | Acres in study area |
|-------------------------------|---------------------------|---------------------|
| Developed (incl. golf course) | 22.42                     | 26.71               |
| Disturbed Land                | 2.81                      | 8.95                |
| Ornamental                    | 0.16                      | 0.33                |
| <b>Total</b>                  | <b>25.39</b>              | <b>35.99</b>        |

**Special Status Plant and Animal Species**

Sensitive plants, animals, and habitats are defined here as rare and/or endangered, or depleted or declining according to the U. S. Fish and Wildlife Service (USFWS), CDFW, and California Native Plant Society (CNPS). General surveys were conducted for plant and animal species and habitats that are considered sensitive according to the USFWS, CNPS and the CDFW's CNDDB record for the area.

No threatened, endangered, or sensitive animal or plant species were observed on-site during the general biological survey. Animal observance on-site was moderate with 15 bird species observed, see Attachment A. Bird species noted were a mix of urban species and seasonal

migrants, including Brewer's blackbird (*Euphagus cyanocephalus*), Eurasian collared-dove (*Streptopelia decaocto*), house finch (*Carpodacus mexicanus*), and yellow-rumped warbler (*Setophaga coronata*). In addition, one mammal species was observed, California ground squirrel (*Otospermophilus beecheyi*).

CNDDDB records were used to help determine if sensitive species occur within the vicinity of the project site. Based on the developed and disturbed condition of the site and lack of native habitats, the site does not have potential to support sensitive species as detailed in Table 2 below.

**Table 2. CNDDDB Species Recorded within Vicinity of the Site**

| Species   | Potential to Occur/Comments  |
|---|--|
| marsh sandwort ( <i>Arenaria paludicola</i> )                                 | None. Species occurs in marsh habitats, which are not present on site.   |
| bristly sedge ( <i>Carex comosa</i> )   | None. Species occurs in wetland and riparian habitats, which are not present in the parcel. Species is most often associated with lake margins and edges, which are not present on site.   |
| Busck's gallmoth ( <i>Carolella busckana</i> )                                | None. Species occurs in coastal scrub dunes that are not present on site.  |
| smooth tarplant ( <i>Centromadia pungens</i> ssp. <i>laevis</i> )             | None. Species occurs in habitats such as chenopod scrub, meadows and seeps, playas, riparian woodlands, and valley and foothill grasslands. No suitable habitat types are present on site. |
| salt marsh bird's beak ( <i>Chloropyron maritimum</i> ssp. <i>maritimum</i> ) | None. Species occurs on salt marshes and salt flats, which are not present on site.  |
| Parry's spineflower ( <i>Chorizanthe parryi</i> var. <i>parryi</i> )          | None. Species occurs on chaparral and coastal sage scrub habitats, which are not present on site.  |
| western yellow-billed cuckoo ( <i>Coccyzus americanus occidentalis</i> )      | None. Species occurs in riparian habitats, which are not present on site.  |
| Peruvian dodder ( <i>Cuscuta obtusiflora</i> var. <i>glandulosa</i> )         | None. Species occurs in freshwater marshes and swamps that are not present on site.  |
| San Bernardino kangaroo rat ( <i>Dipodomys merriami parvus</i> )              | None. Species occurs in alluvial fan sage scrub habitats, which are not present in the parcel. These habitat types are confined to rivers and floodplains, which are not present on site.  |
| slender-horned spineflower ( <i>Dodecahema leptoceras</i> )                   | None. Species occurs in alluvial scrub habitats, which are not present on site.  |
| Los Angeles sunflower ( <i>Helianthus nuttallii</i> ssp. <i>parishii</i> )    | None. Species occurs in freshwater or salt marsh habitats, which are not present on site.  |
| Gambel's water cress ( <i>Nasturtium gambelii</i> )                           | None. Species is aquatic or semi-aquatic. It is found in lakesides and marshes, which are not present on site.   |
| pocketed free-tailed bat ( <i>Nyctinomops femorosaccus</i> )                  | None. Species is associated with cliffs and rocky outcrops, which are not present on site.   |
| Delhi Sands flower-loving fly ( <i>Rhaphiomidas terminates abdominalis</i> )  | None. Species occurs in Delhi sand habitats, which are not present on site.  |
| Parish's gooseberry ( <i>Ribes divaricatum</i> )                              | None. Species occurs in wetland habitats and   |

|  |  |
|--|--|
| var. <i>parishii</i> )                               | occasionally in coastal sage scrub habitats, which are not present on site.  |
| prairie wedge-grass ( <i>Sphenopholis obtusata</i> ) | None. Species occurs in mesic prairies, thinly wooded bluffs, open rocky woodlands, and pasture habitats, which are not present on site. |
| least Bell's vireo ( <i>Vireo bellii pusillus</i> )  | None. Species occurs in riparian and willow scrub habitats, which are not present on site.   |

## Conclusion

Based on the database review and biological field survey, the site does not support sensitive plants, animals, or habitats. The site is nearly 90% developed with residential housing and public golf course and lacks native vegetation communities. The site does not support significant biological constraints to development.

Please do not hesitate to contact me if you have any questions or concerns about this report.

Sincerely,

Jim Rocks

### Cultural Resource Study Findings Memo

February 16, 2016

Karina Fidler, AICP, CPESC  
Kimley-Horn  
401 B Street, Suite 600  
San Diego, California 92101

Re: Cultural Resource Study Findings Memo for the Waterman Industrial Center, San Bernardino, San Bernardino County, California

Dear Ms. Fidler,

This letter report documents the results of the cultural resource study conducted for the Waterman Industrial Center Project (Project) by ASM Affiliates, Inc. (ASM). The study was completed in compliance with California Environmental Quality Act (CEQA) requirements. The lead agency is the City of San Bernardino. This document is part of an Initial Study to address the potential environmental impacts of the proposed project pursuant to the required provisions of CEQA, Public Resources Code Section 21000 et seq., and State CEQA Guidelines Section 15063.

The study included a records search at the South Central Coastal Information Center (SCCIC), a search of the Sacred Lands File of the California Native American Heritage Commission (NAHC), and a pedestrian survey of accessible portions of the Project area. One cultural resource, Waterman-1, consisting of a sparse historic artifact scatter dating ca. 1920s was identified. Monitoring of the Project area by a qualified archaeological monitor during the initial ground disturbance for the Project is recommended.

### **Project Description and Location**

The proposed project site is located in the south-central portion of the City of San Bernardino. The Project area is shown on the USGS 7.5-minute San Bernardino South, Calif. topographic quadrangle in an unsectioned area of Township 1 South, Range 4 West. The project site encompasses 12 parcels (Assessor Parcel Numbers [APNs] 014-143-101, 014-143-102, 014-143-103, 014-143-104, 014-143-108, 014-143-109, 014-143-110, 014-143-111, 0104-143-112, 014-143-116, 014-143-120, and 014-143-121) on approximately 26 acres and is bounded by East Dumas Drive to the north and South Waterman Avenue to the east (Figure 1). Current uses on the 12 parcels include: five vacant parcels, five parcels with single family residential homes, two parcels with a church, and one parcel is used as a golf driving range attached to the San Bernardino Golf Club. The site is not located in an area of archaeological or historical sensitivity as identified by the City.

The proposed Waterman Industrial Center is a 564,652 SF industrial building with office space, parking, a pump house, and landscaping. The industrial building would be one floor with a maximum height of 43 feet. The building would be a cross dock warehouse facility, with dedicated office/mezzanine space of 10,000 SF. The site will also include a 427 SF pump house.

The building would have 49 dock doors on its northern frontage and 49 on its southern frontage. Site access would be provided via one signalized full movement driveway on Waterman Avenue and two full movement driveways on Dumas Drive. Total on-site parking would be 452 stalls, with 286 dedicated to warehouse parking (including office) and 166 trailer parking spaces. Landscaping in the amount of 103,585 SF is anticipated for the site and the southwest corner of the site would be used as a stormwater/water quality control basin. Roadway frontage improvements would be provided on Waterman Avenue and Dumas Drive. The project would also include an approximate 1,000-foot long, 12-foot high concrete screen wall on the southern boundary of the site. An approximate 200-foot, 12-foot high concrete screen wall segment and an approximate 600-foot long, 8-foot-high high tube steel fence would be constructed on the western boundary of the site.

## **Cultural and Environmental Setting**

### Natural Setting

The City of San Bernardino is located approximately 60 miles east of the City of Los Angeles, at the southern base of the San Bernardino Mountains. It lies in the upper Santa Ana River Valley, and is bounded by the San Bernardino Mountains on the northeast and east, Blue Mountain and Box Springs Mountain abutting the Cities of Loma Linda and Redlands to the south, and the San Gabriel Mountains and Jurupa Hills to the northwest and southwest, respectively. The City is largely urbanized and surrounded by other developed cities; the Project area is similarly highly urbanized.

### Prehistoric Period

Archaeological investigations in San Bernardino County and elsewhere in southern California have documented a diverse range of prehistoric human occupations, extending from the terminal Pleistocene down to the time of European contact (Koerper and Drover 1983; Mason 1984; McKenna 1986; Wallace 1955; Warren 1968).

### Paleoindian (pre-6000 B.C.)

Paleoindian assemblages include large stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of ground stone tools. These tools suggest a reliance on hunting rather than gathering. In general, hunting-related tools are more common during this period and are replaced by processing tools during the early Holocene (Basgall and Hall 1990).

### Milling Stone Horizon (6000 B.C. – 750 A.D.)

The Milling Stone Horizon is characterized by the presence of hand stones, milling stones, choppers, and scrapers. These tools are thought to be associated with seed gathering and processing and limited hunting activities. The artifacts from this period show a major shift in the exploitation of natural resources.

### Late Prehistoric Horizon (A.D. 750-1750)

Like much of Southern California, this horizon in the general Project area is characterized by the presence of small projectile points associated with the use of bow and arrow. Steatite containers, asphaltum items, mortars and pestles, and bedrock mortars are also common artifacts.

### Ethnohistoric Period (Post A.D. 1750)

The Project area is within the ethnohistoric territory of the Gabrielino Indians, and along the border of the Serrano's territory within the mountains. Both the Gabrielino and Serrano claim the area as part of their traditional homeland. The Gabrielino name derived from their association with the San Gabriel Valley and the Mission San Gabriel de Archangel (Bean and Smith 1978a, 1978b).

Both the Serrano and the Gabrielino utilized numerous plants and animals for food, shelter, and medicines (Kroeber 1976). Seeds were most often used followed by foliage, shoots, fruits, and berries. Mountain shrubs, ash, elder, and willow were used for shelters and tool materials such as bows. Fauna used as food sources included deer, rabbits, wood rats, squirrels, quail, and ducks. Animals specifically not used were dog, coyote, bear, tree squirrel, pigeon, dove, mud hen, eagle, buzzard, raven, lizards, frogs, and turtles (Kroeber 1976).

The Serrano and Gabrielino used numerous styles of bows, bedrock mortars, portable mortars, pipes, chisels, metates, manos, and various forms of chipped stone tools. Prior to the establishment of the Mission system Native Americans lived larger villages, associated with smaller villages with limited activity areas and smaller populations. Seasonal migration was practiced across the area for both the exploitation of resources and based on seasonal weather conditions.

### Historic Period

#### Spanish and Mexican Periods

Spanish explorer Juan Rodríguez Cabrillo first discovered California in 1542, claiming it for the King of Spain. However, Spanish contact within the vicinity of the Project area did not take place until the 1770s when Father Garces traveled across the Mojave Desert and entered coastal southern California through the Cajon Pass (Walker 1968).

The Mission San Gabriel de Archangel was established in 1771 and claimed what are now the San Gabriel and San Bernardino valleys. In 1819, a mission outpost, or asistencia, was established in the area of present-day Redlands (Dumke 1944; Hanna 1951; McWilliams 1973; Scott 1977). This outpost, part of Mission San Gabriel's Rancho San Bernardino, was established in order to expand the agricultural holdings of Mission San Gabriel. The asistencia was later moved to its current location, where construction began in 1830; it was abandoned soon after in 1834 (Lugo 1950).

The Mexican War of Independence ended in 1821, severing the Spanish hold on the Californias and secularizing former mission lands. A series of ranchos was granted throughout the San Bernardino Valley and much of the land was used for ranching activities. Although some land had been granted to Indians, most of the land went to military men or merchants. In 1842, the Lugo family was granted the Rancho San Bernardino, which encompassed approximately 37,700 acres.

Granting large ranch lands or ranchos remained as both a Spanish and a Mexican legacy in California. Land granted to Mexicans between 1833 and 1846 amounted to 500 ranchos

primarily granted near the coast from San Francisco to San Diego. Mexican Governor Pío Pico granted a great number of those ranchos prior to 1846, quickly carving up Alta California to ensure Mexican land titles survived a U.S. victory in the Mexican-American War (1846-1848) (Christenson and Sweet 2008:7; Engstrand 2005:64-66; Robinson 1948:23-72).

### American Period

(from [http://www.ci.san-bernardino.ca.us/about/history/history\\_of\\_san\\_bernardino\\_\(short\\_version\).asp](http://www.ci.san-bernardino.ca.us/about/history/history_of_san_bernardino_(short_version).asp))

The first non-Mexican settlers to the area were the Mormon pioneers who were directed by Brigham Young to establish a colony in the San Bernardino Valley. They purchased 35,000 acres of the Rancho San Bernardino in 1851, for \$77,500, with a down payment of \$7,000. The Mormons built a stockade around the rancho and named it Fort San Bernardino. The families lived inside the stockade for the first few years. They grew wheat and other crops outside and a grain mill inside. After their fear of attack from local Native Americans abated, the residents moved outside the stockade and began building homes in the area.

In the fall of 1852, Colonel Henry Washington, a United States deputy surveyor, erected a monument on top of Mount San Bernardino, creating the San Bernardino base line from which surveys in the southern part of the state were, and are still made. In 1854, the City of San Bernardino was officially incorporated. The population at the time was 1,200, with 900 of them Mormons; as such, the early city was a temperance town, with no drinking or gambling allowed. Brigham Young recalled the Mormons to Salt Lake City in 1857, some of whom left, while others opted to remain in the new city. Though only in the area en masse for six years, the Mormons made numerous achievements, establishing schools, stores, a network of roads, and a strong government.

Gold was discovered in Holcomb Valley in 1860, prompting prospectors to pour into the mountains through San Bernardino to try their luck at panning. For a time Belleville, in Holcomb Valley, was the largest city in Southern California with 10,000 residents, and it almost became the county seat, losing to San Bernardino by only one vote.

The large railway companies eventually found their way to San Bernardino in the last years of the nineteenth century, raising the profile of the city. The Santa Fe, the Union Pacific, and the Southern Pacific railroads all converged on the city, making it the hub of their southern California operations. Competition between the railroads set off a rate war, which brought thousands of newcomers to California in the great land boom of the 1880s. When the Santa Fe Railway established a transcontinental link in 1886, the already prosperous valley exploded, with even more settlers now coming from the East. Population figures doubled, from 6,150 in 1900 to 12,779 in 1910, the year that the San Bernardino Chamber of Commerce was first organized.

## Study Methods

Methods used to assess the presence of and potential for cultural resources within the property included a search of existing records and a pedestrian field survey. The records search was conducted by the SCCIC on October 27, 2015. The search included the Project area and a radius of 1 mi. around it. Historic aerial photographs and historic USGS topographic maps of the Project area were consulted from [historicaerials.com](http://historicaerials.com).

The field survey was conducted on November 5, 2015 by ASM Senior Archaeologist Sherri Andrews. Field methods consisted of a pedestrian survey of accessible areas within the proposed Project site using transects spaced at 15-m intervals and visual assessment of the currently occupied parcels.

## Study Results

### Records Search Results

The records search at the SCCIC identified 28 previous cultural resource studies that had been conducted within a 1-mi. radius (Table 1). None of the studies have been conducted directly within the Project area.

Table 1. Previous Cultural Resources Reports Addressing the Project Area and the 1-mi. Records Search Radius

Twelve cultural resources have been previously recorded within the 1-mi. records search radius (Table 2); 10 are historic, one prehistoric, and one with both historic and prehistoric attributes. No resources have been previously documented within the Project area. Only two of the previously documented resources are within less than ½ mi. of the Project area; both historic,

they are situated about a block north of the area. Both of the prehistoric cultural resources are approximately 1 mi. from the Project area.

Table 2. Previously Recorded Cultural Resources within the 1-mi. Records Search Radius

| Primary # (P-36-) | Trinomial (CA-SBR-) | Other ID                               | Recorded by / date               | Site Type             | Attribute Codes   | Relationship to Project Area             |

### Historical Research

Historic aerial photographs covering the Project area from 1938, 1959, 1966, 1968, 1980, 1994, 2002, 2005, 2009, 2010, and 2012; and historic USGS 7.5-minute topographic quadrangles from 1896, 1898, 1901, 1905, 1909, 1913, 1926, 1929, 1938, 1943, 1946, 1955, 1959, 1963, 1965, 1969, 1974, 1977, and 1981 were consulted from [historicaerials.com](http://historicaerials.com).

The historic topographic map from 1896 shows that the project area was already in use. A structure is depicted facing Dumas Drive just west of Waterman, another appears to be facing Waterman south of Dumas, and the A.T.&S.F. Railroad (Redlands Line) runs northwest/southeast just to the northeast of the intersection. No other structures appear within the project area until the 1938 aerial, and later on the 1943 topo, when another structure appears further to the south along Waterman, just south of an east/west spur road. In the 1943 topo, the position of the structure facing Dumas appears shifted to the west nearer to the intersection. On the 1955 topo, three additional structures are now located near the eastern edge of the project area along Waterman, with one newly depicted structure near the center of the area at the end of the spur road, which is also now depicted on the topo. Another structure appears in this general area in 1963. In 1969, the structure in the center of the area is gone, three structures are lined up facing Dumas near Waterman and three structures are clustered to the south along Waterman. The church first appears in this image, as well as three additional structures facing Dumas appearing to the west, with another cluster of four structures along Dumas near the western edge of the project area. An additional structure just southeast of the church appears in 1974, with five other structures appearing in the west and south of the project area; two more structures appear in the southern area on the 1981 topo.

Only aerials photos are available after 1981. The 1994 photo indicates that most, if not all of the structures in the southern half of the area are gone; by 2002, they are definitely gone and it is possible that the driving range is already in existence.

#### NAHC Sacred Lands File Search

On November 2, 2015, ASM sent a request to the NAHC to search their Sacred Lands File (SLF) to determine whether their files contained any information relating to the presence of Native American cultural resources within the Project parcel. Response from the NAHC was received on December 17, 2015, indicating that no such resources were found as a result of the SLF search. However, the absence of specific site information in the SLF does not indicate the absence of Native American cultural resources within the Project area. A list of 16 tribal contacts who may have interest in the Project area was provided with the NAHC response; this response and contact list is provided with this report as Appendix B.

#### Pedestrian Survey Results

The Project is located within a relatively flat landscape that has been entirely previously disturbed. The north half, comprising 11 of the 12 parcels, contains multiple single-family residences and two churches; the single parcel comprising the southern half is a fully landscaped and maintained operational golf driving range. The accessible and unmaintained portions of the Project area are covered with dry non-native grasses. Some modern refuse disposal has taken place in the open parcels, especially the parcel directly at the corner of East Dumas Drive and South Waterman Avenue. All of the open parcels show evidence of having been extensively disturbed by agricultural uses, residential or commercial development, the removal of buildings, grading, and vegetation removal (Figures 2 and 3). One previously unrecorded cultural resource, Waterman-1, a historic artifact scatter, was documented; no evidence was found within the Project area of the presence of or potential for any prehistoric resources. The DPR form for this resource can be found in Appendix A.

Waterman-1 consists of a scatter of highly fragmented historic artifacts, likely dating to the earliest occupation of the parcel. Artifacts found here include dozens of glass fragments, ceramic and porcelain fragments; etc. It should be noted, however, that some modern refuse is mixed with the historic materials to the same depths, further evidencing the significant disturbance that the parcel has undergone over the decades.

The glass fragments included amethyst, cobalt, milk, green, brown, clear, and a partial clear milk bottle finish. The milk glass fragment was decorative, with an Art Deco-like or thatch pattern. Ceramics and porcelain included a small porcelain doll arm, a tea cup handle, a plate base, a plate rim with a blue Japanese style transfer print, a cup rim with a black and a brown stripe, and a piece of a melamine or plastic dinner plate with a starburst design.

A single porcelain plate fragment with a partial maker's mark was found: ...LLARNEY (in banner) / ...ORCELAIN / (crown design). No date could be found for this mark. This leaves the only item with a bracketable date range as the amethyst glass. A piece of decorative glass was found as well as some other nondescript fragments; none had any other temporally diagnostic features. Amethyst glass dates ca. 1880-1920, which corresponds to the single structure depicted in the early maps and photos. It does not appear that this early structure is the same house that is currently extant at 285 East Dumas Street; these structures appear in somewhat different locations. As such, at least some of the deposit was likely related to the now removed earliest structure in the Project area. However, some of the fragments in the scatter appear to be of later vintage, ca. 1950s-1960s. As such, this is a mixed deposit likely from various episodes of refuse disposal into what may have long served as a sort of communal backyard area for the houses lining the edges of this parcel.

### **California Register of Historic Resources (CRHR)**

For purposes of CEQA, a historic resource is any object, building, structure, site, area, place, record, or manuscript listed in or eligible for listing in the CRHR (PRC §5024.1, Title 14 CCR, §4852). A resource is eligible for listing in the CRHR if it meets any of the following criteria:

- (1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage
- (2) Is associated with the lives of persons important in our past
- (3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values
- (4) Has yielded, or may be likely to yield, information important to prehistory or history.

## **Recommendations**

A single previously undocumented resource, Waterman-1, consisting of a scatter of highly fragmented historic artifacts, was identified within the northeastern portion of the Project area. No evidence of intact subsurface deposits was identified. Historic buildings were once present within this portion of the Project area, but most have been removed. Archaeological sites are generally assessed for eligibility under Criterion 4 for their research potential. As highly fragmentary and disturbed remains, unassociated with intact archaeological deposits or features, Waterman-1 is recommended not eligible for listing in the California Register of Historic Resources as it fails to meet the criteria for listing.

The results of the records search, the historical map and photo analysis, and the current survey suggest a low archaeological sensitivity for the Project area as a whole. However, ASM recommends that the Project area be monitored by a qualified archaeological monitor during the initial ground disturbance for the Project's construction as there is a possibility of currently undetectable historic subsurface deposits being present within the Project area due to the area's early residential development.

Should you have any questions regarding this study, please do not hesitate to contact me.

Respectfully submitted,

Sherri Andrews, M.A., RPA  
Senior Archaeologist

Re: Cultural Resource Study Findings Memo for the Waterman Industrial Center, San Bernardino, San Bernardino County, California

Dear Ms. Fidler,

This letter report documents the results of the cultural resource study conducted for the Waterman Industrial Center Project (Project) by ASM Affiliates, Inc. (ASM). The study was completed in compliance with California Environmental Quality Act (CEQA) requirements. The lead agency is the City of San Bernardino. This document is part of an Initial Study to address the potential environmental impacts of the proposed project pursuant to the required provisions of CEQA, Public Resources Code Section 21000 et seq., and State CEQA Guidelines Section 15063.

The study included a records search at the South Central Coastal Information Center (SCCIC), a search of the Sacred Lands File of the California Native American Heritage Commission (NAHC), and a pedestrian survey of accessible portions of the Project area. One cultural resource, Waterman-1, consisting of a sparse historic artifact scatter dating ca. 1920s was identified. Monitoring of the Project area by a qualified archaeological monitor during the initial ground disturbance for the Project is recommended.

### **Project Description and Location**

The proposed project site is located in the south-central portion of the City of San Bernardino. The Project area is shown on the USGS 7.5-minute San Bernardino South, Calif. topographic quadrangle in an unsectioned area of Township 1 South, Range 4 West. The project site encompasses 12 parcels (Assessor Parcel Numbers [APNs] 014-143-101, 014-143-102, 014-143-103, 014-143-104, 014-143-108, 014-143-109, 014-143-110, 014-143-111, 0104-143-112, 014-143-116, 014-143-120, and 014-143-121) on approximately 26 acres and is bounded by East Dumas Drive to the north and South Waterman Avenue to the east (Figure 1). Current uses on the 12 parcels include: five vacant parcels, five parcels with single family residential homes, two parcels with a church, and one parcel is used as a golf driving range attached to the San Bernardino Golf Club. The site is not located in an area of archaeological or historical sensitivity as identified by the City.

The proposed Waterman Industrial Center is a 564,652 SF industrial building with office space, parking, a pump house, and landscaping. The industrial building would be one floor with a maximum height of 43 feet. The building would be a cross dock warehouse facility, with dedicated office/mezzanine space of 10,000 SF. The site will also include a 427 SF pump house.

The building would have 49 dock doors on its northern frontage and 49 on its southern frontage. Site access would be provided via one signalized full movement driveway on Waterman Avenue and two full movement driveways on Dumas Drive. Total on-site parking would be 452 stalls, with 286 dedicated to warehouse parking (including office) and 166 trailer parking spaces. Landscaping in the amount of 103,585 SF is anticipated for the site and the southwest corner of the site would be used as a stormwater/water quality control basin. Roadway frontage improvements would be provided on Waterman Avenue and Dumas Drive. The project would also include an approximate 1,000-foot long, 12-foot high concrete screen wall on the southern boundary of the site. An approximate 200-foot, 12-foot high concrete screen wall segment and an approximate 600-foot long, 8-foot-high high tube steel fence would be constructed on the western boundary of the site.

## **Cultural and Environmental Setting**

### Natural Setting

The City of San Bernardino is located approximately 60 miles east of the City of Los Angeles, at the southern base of the San Bernardino Mountains. It lies in the upper Santa Ana River Valley, and is bounded by the San Bernardino Mountains on the northeast and east, Blue Mountain and Box Springs Mountain abutting the Cities of Loma Linda and Redlands to the south, and the San Gabriel Mountains and Jurupa Hills to the northwest and southwest, respectively. The City is largely urbanized and surrounded by other developed cities; the Project area is similarly highly urbanized.

### Prehistoric Period

Archaeological investigations in San Bernardino County and elsewhere in southern California have documented a diverse range of prehistoric human occupations, extending from the terminal Pleistocene down to the time of European contact (Koerper and Drover 1983; Mason 1984; McKenna 1986; Wallace 1955; Warren 1968).

### Paleoindian (pre-6000 B.C.)

Paleoindian assemblages include large stemmed projectile points, high proportions of formal lithic tools, bifacial lithic reduction strategies, and relatively small proportions of ground stone tools. These tools suggest a reliance on hunting rather than gathering. In general, hunting-related tools are more common during this period and are replaced by processing tools during the early Holocene (Basgall and Hall 1990).

### Milling Stone Horizon (6000 B.C. – 750 A.D.)

The Milling Stone Horizon is characterized by the presence of hand stones, milling stones, choppers, and scrapers. These tools are thought to be associated with seed gathering and processing and limited hunting activities. The artifacts from this period show a major shift in the exploitation of natural resources.

### Late Prehistoric Horizon (A.D. 750-1750)

Like much of Southern California, this horizon in the general Project area is characterized by the presence of small projectile points associated with the use of bow and arrow. Steatite containers, asphaltum items, mortars and pestles, and bedrock mortars are also common artifacts.

### Ethnohistoric Period (Post A.D. 1750)

The Project area is within the ethnohistoric territory of the Gabrielino Indians, and along the border of the Serrano's territory within the mountains. Both the Gabrielino and Serrano claim the area as part of their traditional homeland. The Gabrielino name derived from their association with the San Gabriel Valley and the Mission San Gabriel de Archangel (Bean and Smith 1978a, 1978b).

Both the Serrano and the Gabrielino utilized numerous plants and animals for food, shelter, and medicines (Kroeber 1976). Seeds were most often used followed by foliage, shoots, fruits, and berries. Mountain shrubs, ash, elder, and willow were used for shelters and tool materials such as bows. Fauna used as food sources included deer, rabbits, wood rats, squirrels, quail, and ducks. Animals specifically not used were dog, coyote, bear, tree squirrel, pigeon, dove, mud hen, eagle, buzzard, raven, lizards, frogs, and turtles (Kroeber 1976).

The Serrano and Gabrielino used numerous styles of bows, bedrock mortars, portable mortars, pipes, chisels, metates, manos, and various forms of chipped stone tools. Prior to the establishment of the Mission system Native Americans lived larger villages, associated with smaller villages with limited activity areas and smaller populations. Seasonal migration was practiced across the area for both the exploitation of resources and based on seasonal weather conditions.

### Historic Period

#### Spanish and Mexican Periods

Spanish explorer Juan Rodríguez Cabrillo first discovered California in 1542, claiming it for the King of Spain. However, Spanish contact within the vicinity of the Project area did not take place until the 1770s when Father Garces traveled across the Mojave Desert and entered coastal southern California through the Cajon Pass (Walker 1968).

The Mission San Gabriel de Archangel was established in 1771 and claimed what are now the San Gabriel and San Bernardino valleys. In 1819, a mission outpost, or asistencia, was established in the area of present-day Redlands (Dumke 1944; Hanna 1951; McWilliams 1973; Scott 1977). This outpost, part of Mission San Gabriel's Rancho San Bernardino, was established in order to expand the agricultural holdings of Mission San Gabriel. The asistencia was later moved to its current location, where construction began in 1830; it was abandoned soon after in 1834 (Lugo 1950).

The Mexican War of Independence ended in 1821, severing the Spanish hold on the Californias and secularizing former mission lands. A series of ranchos was granted throughout the San Bernardino Valley and much of the land was used for ranching activities. Although some land had been granted to Indians, most of the land went to military men or merchants. In 1842, the Lugo family was granted the Rancho San Bernardino, which encompassed approximately 37,700 acres.

Granting large ranch lands or ranchos remained as both a Spanish and a Mexican legacy in California. Land granted to Mexicans between 1833 and 1846 amounted to 500 ranchos

primarily granted near the coast from San Francisco to San Diego. Mexican Governor Pío Pico granted a great number of those ranchos prior to 1846, quickly carving up Alta California to ensure Mexican land titles survived a U.S. victory in the Mexican-American War (1846-1848) (Christenson and Sweet 2008:7; Engstrand 2005:64-66; Robinson 1948:23-72).

### American Period

(from [http://www.ci.san-bernardino.ca.us/about/history/history\\_of\\_san\\_bernardino\\_\(short\\_version\).asp](http://www.ci.san-bernardino.ca.us/about/history/history_of_san_bernardino_(short_version).asp))

The first non-Mexican settlers to the area were the Mormon pioneers who were directed by Brigham Young to establish a colony in the San Bernardino Valley. They purchased 35,000 acres of the Rancho San Bernardino in 1851, for \$77,500, with a down payment of \$7,000. The Mormons built a stockade around the rancho and named it Fort San Bernardino. The families lived inside the stockade for the first few years. They grew wheat and other crops outside and a grain mill inside. After their fear of attack from local Native Americans abated, the residents moved outside the stockade and began building homes in the area.

In the fall of 1852, Colonel Henry Washington, a United States deputy surveyor, erected a monument on top of Mount San Bernardino, creating the San Bernardino base line from which surveys in the southern part of the state were, and are still made. In 1854, the City of San Bernardino was officially incorporated. The population at the time was 1,200, with 900 of them Mormons; as such, the early city was a temperance town, with no drinking or gambling allowed. Brigham Young recalled the Mormons to Salt Lake City in 1857, some of whom left, while others opted to remain in the new city. Though only in the area en masse for six years, the Mormons made numerous achievements, establishing schools, stores, a network of roads, and a strong government.

Gold was discovered in Holcomb Valley in 1860, prompting prospectors to pour into the mountains through San Bernardino to try their luck at panning. For a time Belleville, in Holcomb Valley, was the largest city in Southern California with 10,000 residents, and it almost became the county seat, losing to San Bernardino by only one vote.

The large railway companies eventually found their way to San Bernardino in the last years of the nineteenth century, raising the profile of the city. The Santa Fe, the Union Pacific, and the Southern Pacific railroads all converged on the city, making it the hub of their southern California operations. Competition between the railroads set off a rate war, which brought thousands of newcomers to California in the great land boom of the 1880s. When the Santa Fe Railway established a transcontinental link in 1886, the already prosperous valley exploded, with even more settlers now coming from the East. Population figures doubled, from 6,150 in 1900 to 12,779 in 1910, the year that the San Bernardino Chamber of Commerce was first organized.

**Study Methods**

Methods used to assess the presence of and potential for cultural resources within the property included a search of existing records and a pedestrian field survey. The records search was conducted by the SCCIC on October 27, 2015. The search included the Project area and a radius of 0.25 mi. around it. Historic aerial photographs and historic USGS topographic maps of the Project area were consulted from [historicaerials.com](http://historicaerials.com).

The field survey was conducted on November 5, 2015 by ASM Senior Archaeologist Sherri Andrews. Field methods consisted of a pedestrian survey of accessible areas within the proposed Project site using transects spaced at 15-m intervals and visual assessment of the currently occupied parcels.

**Study Results**

Records Search Results

The records search at the SCCIC identified four previous cultural resource studies that had been conducted within the 0.25-mi. radius (Table 1). None of the studies have been conducted directly within the Project area.

Table 1. Previous Cultural Resources Reports Addressing the Project Area and the 0.25-mi. Records Search Radius

| Report No (SB-) | Year | Author(s)/Affiliation  | Title   |
|-----------------|------|--|---|
| 01808           | 1988 | Hampson, R. Paul, Jerrel Sorensen, Susan K. Goldberg, Mark T. Swanson, and Jeanne E. Arnold / Greenwood & Associates and Infotec | Cultural Resources Survey, Upper Santa Ana River, California  |
| 03228           | 1995 | Lerch, Michael K. / Tom Dodson & Associates  | Historic Property Survey Report: Orange Show Road Extension, City of San Bernardino, CA   |
| 06331           | 2009 | Cannon, Amanda, and Michael K. Lerch   | Cultural Resources Assessment of the Riverside-Corona Realignment, San Bernardino and Riverside Counties, California                        |
| 07528           | 2012 | Hogan, Michael, Bai "Tom" Tang, Terri Jacquemain, Daniel Ballester, and Nina Gallardo / CRM Tech                                 | Identification and Evaluation of Historic Properties: Cleanwater Factory Project, City of San Bernardino, San Bernardino County, California |

Two cultural resources have been previously recorded within the 0.25-mi. records search radius (Table 2); none have been documented within the Project area. Both of the previously recorded resources are historic; no prehistoric cultural resources have been documented.

Table 2. Previously Recorded Cultural Resources within the 0.25-mi. Records Search Radius

| Primary # (P-36-) | Trinomial (CA-SBR-) | Recorded by / date           | Site Type              |
|-------------------|---------------------|------------------------------|------------------------|
| 006847            | 6847H               | Multiple records / 1990-2014 | Historic Railroad      |
| 017668            | -                   | Donaldson / 1994             | Single Family Property |

### Historical Research

Historic aerial photographs covering the Project area from 1938, 1959, 1966, 1968, 1980, 1994, 2002, 2005, 2009, 2010, and 2012; and historic USGS 7.5-minute topographic quadrangles from 1896, 1898, 1901, 1905, 1909, 1913, 1926, 1929, 1938, 1943, 1946, 1955, 1959, 1963, 1965, 1969, 1974, 1977, and 1981 were consulted from [historicaerials.com](http://historicaerials.com).

The historic topographic map from 1896 shows that the project area was already in use. A structure is depicted facing Dumas Drive just west of Waterman, another appears to be facing Waterman south of Dumas, and the A.T.&S.F. Railroad (Redlands Line) runs northwest/southeast just to the northeast of the intersection. No other structures appear within the project area until the 1938 aerial, and later on the 1943 topo, when another structure appears further to the south along Waterman, just south of an east/west spur road. In the 1943 topo, the position of the structure facing Dumas appears shifted to the west nearer to the intersection. On the 1955 topo, three additional structures are now located near the eastern edge of the project area along Waterman, with one newly depicted structure near the center of the area at the end of the spur road, which is also now depicted on the topo. Another structure appears in this general area in 1963. In 1969, the structure in the center of the area is gone, three structures are lined up facing Dumas near Waterman and three structures are clustered to the south along Waterman. The church first appears in this image, as well as three additional structures facing Dumas appearing to the west, with another cluster of four structures along Dumas near the western edge of the project area. An additional structure just southeast of the church appears in 1974, with five other structures appearing in the west and south of the project area; two more structures appear in the southern area on the 1981 topo.

Only aerials photos are available after 1981. The 1994 photo indicates that most, if not all of the structures in the southern half of the area are gone; by 2002, they are definitely gone and it is possible that the driving range is already in existence.

### NAHC Sacred Lands File Search

On November 2, 2015, ASM sent a request to the NAHC to search their Sacred Lands File (SLF) to determine whether their files contained any information relating to the presence of Native American cultural resources within the Project parcel. Response from the NAHC was received on December 17, 2015, indicating that no such resources were found as a result of the SLF search. However, the absence of specific site information in the SLF does not indicate the absence of Native American cultural resources within the Project area. A list of 16 tribal contacts who may have interest in the Project area was provided with the NAHC response; this response and contact list is provided with this report as Appendix B.

### Pedestrian Survey Results

The Project is located within a relatively flat landscape that has been entirely previously disturbed. The north half, comprising 11 of the 12 parcels, contains multiple single-family residences and two churches; the single parcel comprising the southern half is a fully landscaped and maintained operational golf driving range. The accessible and unmaintained portions of the Project area are covered with dry non-native grasses. Some modern refuse disposal has taken place in the open parcels, especially the parcel directly at the corner of East Dumas Drive and South Waterman Avenue. All of the open parcels show evidence of having been extensively

disturbed by agricultural uses, residential or commercial development, the removal of buildings, grading, and vegetation removal (Figures 2 and 3). One previously unrecorded cultural resource, Waterman-1, a historic artifact scatter, was documented; no evidence was found within the Project area of the presence of or potential for any prehistoric resources. The DPR form for this resource can be found in Appendix A.

Waterman-1 consists of a scatter of highly fragmented historic artifacts, likely dating to the earliest occupation of the parcel. Artifacts found here include dozens of glass fragments, ceramic and porcelain fragments; etc. It should be noted, however, that some modern refuse is mixed with the historic materials to the same depths, further evidencing the significant disturbance that the parcel has undergone over the decades.

The glass fragments included amethyst, cobalt, milk, green, brown, clear, and a partial clear milk bottle finish. The milk glass fragment was decorative, with an Art Deco-like or thatch pattern. Ceramics and porcelain included a small porcelain doll arm, a tea cup handle, a plate base, a plate rim with a blue Japanese style transfer print, a cup rim with a black and a brown stripe, and a piece of a melamine or plastic dinner plate with a starburst design.

A single porcelain plate fragment with a partial maker's mark was found: ...LLARNEY (in banner) / ...ORCELAIN / (crown design). No date could be found for this mark. This leaves the only item with a bracketable date range as the amethyst glass. A piece of decorative glass was found as well as some other nondescript fragments; none had any other temporally diagnostic features. Amethyst glass dates ca. 1880-1920, which corresponds to the single structure depicted in the early maps and photos. It does not appear that this early structure is the same house that is currently extant at 285 East Dumas Street; these structures appear in somewhat different locations. As such, at least some of the deposit was likely related to the now removed earliest structure in the Project area. However, some of the fragments in the scatter appear to be of later vintage, ca. 1950s-1960s. As such, this is a mixed deposit likely from various episodes of refuse disposal into what may have long served as a sort of communal backyard area for the houses lining the edges of this parcel.

### **California Register of Historic Resources (CRHR)**

For purposes of CEQA, a historic resource is any object, building, structure, site, area, place, record, or manuscript listed in or eligible for listing in the CRHR (PRC §5024.1, Title 14 CCR, §4852). A resource is eligible for listing in the CRHR if it meets any of the following criteria:

- (1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage
- (2) Is associated with the lives of persons important in our past
- (3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values
- (4) Has yielded, or may be likely to yield, information important to prehistory or history.

## **Recommendations**

A single previously undocumented resource, Waterman-1, consisting of a scatter of highly fragmented historic artifacts, was identified within the northeastern portion of the Project area. No evidence of intact subsurface deposits was identified. Historic buildings were once present within this portion of the Project area, but most have been removed. Archaeological sites are generally assessed for eligibility under Criterion 4 for their research potential. As highly fragmentary and disturbed remains, unassociated with intact archaeological deposits or features, Waterman-1 is recommended not eligible for listing in the California Register of Historic Resources as it fails to meet the criteria for listing.

The results of the records search, the historical map and photo analysis, and the current survey suggest a low archaeological sensitivity for the Project area as a whole. However, ASM recommends that the Project area be monitored by a qualified archaeological monitor during the initial ground disturbance for the Project's construction as there is a possibility of currently undetectable historic subsurface deposits being present within the Project area due to the area's early residential development.

Should you have any questions regarding this study, please do not hesitate to contact me.

Respectfully submitted,

Sherri Andrews, M.A., RPA  
Senior Archaeologist

**P1. Other Identifier:**

\*P2. Location:  Not for Publication  Unrestricted \*a. County: San Bernardino

and (P2b and P2c or P2d. Attach a Location Map as necessary.)

\*b. USGS 7.5' Quad San Bernardino South, CA Date 1980 T 1S; R 4W; \_\_\_ ¼ of \_\_\_ ¼ of Sec \_\_\_; S.B. B.M.

c. Address: \_\_\_\_\_ City: \_\_\_\_\_ Zip: \_\_\_\_\_

d. UTM: Primary datum: NAD 83: Zone 11S; 474236 mE / 3770728 mN

e. Other Locational Data: (e.g., parcel #, directions to resource, elevation, etc., as appropriate) Elevation: 1,010 ft. (308 m)

The site is situated just southwest of the intersection of South Waterman Avenue and East Dumas Street, in the empty lot behind 285 East Dumas Street in the city of San Bernardino.

\*P3a. **Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This is a large (130 ft. E-W x 122 ft. N-S) historic site containing a dispersed scatter of very fragmented artifacts, including dozens of glass fragments, ceramic and porcelain fragments; etc. The glass fragments include amethyst, cobalt, milk, green, brown, clear, and a partial clear milk bottle finish. The milk glass fragment was decorative, with an Art Deco-like or thatch pattern. Ceramics and porcelain included a small porcelain doll arm, a tea cup handle, a plate base, a plate rim with a blue Japanese style transfer print, a cup rim with a black and a brown stripe, and a piece of a melamine or plastic dinner plate with a starburst design. Amethyst glass dates ca. 1880-1920, which corresponds to the single structure depicted in the early maps and photos. As such, at least some of the deposit was likely related to the now removed earliest structure in the Project area. However, some of the fragments in the scatter appear to be of later vintage, ca. 1950s-1960s. As such, this is a mixed deposit likely from various episodes of refuse disposal into what may have long served as a sort of communal backyard area for the houses lining the edges of this parcel.

- \*A4. Features** (Number, briefly describe, indicate size, list associated cultural constituents, and show location of each feature on sketch map.):
- \*A5. Cultural Constituents** (Describe and quantify artifacts, ecofacts, cultural residues, etc., not associated with features.):  
The site area contains a dispersed scatter of very fragmented artifacts, including dozens of glass fragments, ceramic and porcelain fragments; etc. The glass fragments include amethyst, cobalt, milk, green, brown, clear, and a partial clear milk bottle finish. The milk glass fragment was decorative, with an Art Deco-like or thatch pattern. Ceramics and porcelain included a small porcelain doll arm, a tea cup handle, a plate base, a plate rim with a blue Japanese style transfer print, a cup rim with a black and a brown stripe, and a piece of a melamine or plastic dinner plate with a starburst design. A single porcelain plate fragment with a partial maker's mark was found: ...LLARNEY (in banner) / ...ORCELAIN / (crown design). No date could be found for this mark.
- \*A6. Were Specimens Collected?**  No  Yes (If yes, attach Artifact Record or catalog and identify where specimens are curated.)
- \*A7. Site Condition:**  Good  Fair  Poor (Describe disturbances.): Impacts to the site include significant tilling and grading, with modern refuse having been tilled into soils and mixed at equal depths with historic fragments.
- \*A8. Nearest Water** (Type, distance, and direction.): The Santa Ana River is ~0.4 mile to the south.
- \*A9. Elevation:** 1,010 ft. (308 m)
- A10. Environmental Setting:** (Describe culturally relevant variables such as vegetation, fauna, soils, geology, landform, slope, aspect, exposure, etc.) Vegetation in the area is primarily dry introduced grasses, except in areas that are currently landscaped. The landform is essentially flat, and the various parcels have been further flattened by modern modifications.
- A11. Historical Information:** The only artifactual items found with a bracketable date range are the amethyst glass fragments. A piece of decorative glass was found as well as some other nondescript fragments; none had any other temporally diagnostic features. Amethyst glass dates ca. 1880-1920, which corresponds to the single structure depicted in the early maps and photos. It does not appear that this early structure is the same house that is currently extant at 285 East Dumas Street; these structures appear in somewhat different locations. As such, at least some of the deposit was likely related to the now removed earliest structure in the Project area. However, some of the fragments in the scatter appear to be of later vintage, ca. 1950s-1960s. As such, this is a mixed deposit likely from various episodes of refuse disposal into what may have long served as a sort of communal backyard area for the houses lining the edges of this parcel.
- \*A12. Age:**  Prehistoric  Protohistoric  1542-1769  1769-1848  1848-1880  1880-1914  1914-1945  Post 1945

Re.: Waterman Industrial Center Cultural Resources Study, City and County of San Bernardino

Dear Ms. Andrews:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for your project area with negative results, based on the USGS quadrangle information you provided. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE. Other sources of cultural resources information should be contacted regarding known and recorded sites.

Please contact all of the people on the attached list. The list should provide a starting place to locate areas of potential adverse impact within the APE. I suggest you contact all of those listed, if they cannot supply information, they might recommend others with specific knowledge. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at my email address: [rw\\_nahc@pacbell.net](mailto:rw_nahc@pacbell.net).

Sincerely,

A handwritten signature in black ink, appearing to read "Rob Wood".

Attn.: Mr. Jackson Smith

**RE: Geotechnical Engineering Investigation - Proposed Industrial Warehouse Development - Located at the Southwest Corner of Waterman Avenue and Dumas Drive, in the City of San Bernardino, California**

Dear Mr. Smith:

Pursuant to your request, this firm has performed an updated Geotechnical Engineering Investigation for the above referenced project in accordance to our signed proposal dated March 31, 2015. The purpose of this investigation is to evaluate the subsurface conditions of the subject site and to provide recommendations for the proposed industrial warehouse development.

The scope of work included the following: 1) site reconnaissance; 2) review of previous subsurface geotechnical exploration and sampling; 3) laboratory testing; 4) engineering analysis of field and laboratory data; and 5) preparation of a geotechnical engineering report. It is the opinion of this firm that the proposed development is feasible from a geotechnical standpoint provided that the recommendations presented in this report are followed in the design and construction of the project.

### **1.0 Project Description**

It is proposed to construct an industrial warehouse development as shown on the attached conceptual site plan. The project will consist of an industrial warehouse building totaling 562,763 square feet on the 25.25-acre property. The concrete tilt-up building is anticipated to be supported by conventional slab-on-grade foundation systems with perimeter-spread footings and isolated interior footings. Other improvements will consist of asphalt/concrete pavement, hardscape and landscaping. It is assumed that the proposed grading for the entire development will include cut and fill procedures. The latest building plans shall be reviewed by this firm prior to submittal for city approval to determine the need for any additional study and revised recommendations pertinent to the proposed development, if necessary.

### **2.0 Site Description**

The subject property is located at the southwest corner of Waterman Avenue and Dumas Drive, in the City of San Bernardino. The generally rectangular-shaped parcel is elongated in an east to west direction with topography of the relatively level property descending gradually from north to south on the order of a few feet. The site is currently undeveloped land covered with a low growth of vegetation cover consisting of natural grasses and weeds. A majority of the site is currently undeveloped land covered with a low to moderate growth of vegetation cover consisting of natural grasses and weeds. A few small residences are situated along the frontage of Dumas Drive.

### **3.0 Site Exploration**

The investigation consisted of the placement of one (1) subsurface exploratory boring by a truck-mounted drill rig to a depth of 50 feet below current ground elevations and twelve (12) exploratory trenches by a backhoe to depths ranging from 5 to 15 feet below ground surface. The explorations were visually classified and logged by a field engineer with locations of the subsurface explorations shown on the attached Site Plan. The exploratory excavations revealed the existing earth materials to consist of a fill and natural soil. A detailed description of the subsurface conditions is listed on the excavation logs in Appendix A.

It should be noted that the transition from one soil type to another as shown on the borings logs is approximate and may in fact be a gradual transition. The soils encountered are described as follows:

**Fill:** A fill soil and/or disturbed top soil classifying predominately as a light grey, sandy SILT was encountered across the site and ranged in depth from 1 to 2 feet. These soils were noted to be soft and damp. Exploratory Trench T-9 encountered fill to a depth of 6 feet which appears to be from an utility trench excavation backfill.

**Alluvium:** An undisturbed natural soil classifying as a brown to dark brown, sandy SILT to silty SAND was encountered beneath the upper fill soils. These native soils were observed to be firm to medium dense and damp. Deeper soils consisted of gravelly sands to sandy silts and sands.

The overall engineering characteristics of the earth material were relatively uniform with each excavation. Groundwater was measured at an approximate depth of 40 feet below ground surface and some caving occurred in the deeper cohesionless soils.

#### 4.0 Laboratory Tests

Relatively undisturbed samples of the subsurface soils were obtained to perform laboratory testing and analysis for direct shear, consolidation tests, and to determine in-place moisture/densities. These relatively undisturbed ring samples were obtained by driving a thin-walled steel sampler lined with one inch long brass rings with an inside diameter of 2.42 inches into the undisturbed soils. The sampler was driven a total of twelve inches with blow counts taken in six inch increments.

Standard penetration tests were obtained by driving a steel sampler unlined with an inside diameter of 1.5 inches into the soils. This standard penetrometer sampler was driven a total of eighteen inches with blow counts tallied every six inches. Blow count data is given on the Boring Logs in Appendix A. Bulk bag samples were obtained in the upper soils for expansion index tests and maximum density tests. All test results are included in Appendix B, unless otherwise noted.

- 4.1 **Field moisture content** (ASTM: D 2216) and the dry density of the ring samples were determined in the laboratory. This data is listed on the logs of explorations.
- 4.2 **Sieve analyses** (ASTM: D422-63) and the percent by weight of soil finer than the No. 200 sieve (ASTM: 1140) were performed on selected soil samples. These results are shown later within the body of this report.
- 4.3 **Maximum density tests** (ASTM: D-1557) were performed on typical samples of the upper soils. Results of these tests are shown on Table I.
- 4.4 **Expansion index tests** (ASTM: D 4829-07) were performed on remolded samples of the upper soils. Results of these tests are provided on Table II.
- 4.5 **Atterberg Limits** (ASTM: D 4318-05) consisting of liquid limit, plastic limit and plasticity index were performed on representative soil samples. Results are shown on Table III.
- 4.6 **Corrosion tests** consisting of sulfate, pH, resistivity and chloride analysis to determine potential corrosive effects of soils on concrete and underground utilities. These tests are provided on Table IV.
- 4.7 **R-Value test** per California Test Method 301 was performed on a representative sample, which may be anticipated to be near subgrade to determine pavement design. Result is provided within pavement section design section of report.
- 4.8 **Direct shear tests** (ASTM: D-3080) were performed on undisturbed and disturbed samples of the subsurface soils. The test is performed under saturated conditions at loads of 1,000 lbs./sq.ft., 2,000 lbs./sq.ft., and 3,000 lbs./sq.ft. with results shown on Plates A and B.

- 4.9 **Consolidation tests** (ASTM: D-2435) were performed on undisturbed samples to determine the differential and total settlement which may be anticipated based upon the proposed loads. Water was added to the samples at a surcharge of one KSF and the settlement curves are plotted on Plates C and D.

## 5.0 **Seismicity Evaluation**

There are no known active or potentially active faults trending toward or through the site. The proposed development lies outside of any Alquist Priolo Special Studies Zone and the potential for damage due to direct fault rupture is considered very remote. The site is located in an area of high regional seismicity and the San Jacinto (San Bernardino) fault is located less than 2 kilometers from the site. Ground shaking originating from earthquakes along other active faults in the region is expected to induce lower horizontal accelerations due to smaller anticipated earthquakes and/or greater distances to other faults.

The seismic design of the project has been updated to the latest 2010 ASCE 7-10 (with July 2013 errata) standards and the mapped seismic ground motions were provided by using the Java based program available from the United States Geological Survey (USGS) website: <http://geohazards.usgs.gov/designmaps/us/application.php>. The earthquake design parameters are in accordance with the 2013 California Building Code (CBC) and are listed below.

### **Seismic Design Parameters**

|  |                 |           |
|--|-----------------|-----------|
| Site Location                                    | Latitude        | 34.077°   |
|  | Longitude       | -117.281° |
| Site Class                                       |                 | D         |
| Risk Category                                    |                 | I/II/III  |
| Maximum Spectral Response Acceleration           | S <sub>S</sub>  | 2.426g    |
|  | S <sub>1</sub>  | 1.111g    |
| Adjusted Maximum Acceleration                    | S <sub>MS</sub> | 2.426g    |
|  | S <sub>M1</sub> | 1.666g    |
| Design Spectral Response Acceleration Parameters | S <sub>DS</sub> | 1.617g    |
|  | S <sub>D1</sub> | 1.111g    |

## 6.0 Liquefaction Evaluation

The site is expected to experience ground shaking and earthquake activity that is typical of Southern California area. It is during severe ground shaking that loose, granular soils below the groundwater table can liquefy. A review of the exploratory boring logs and the laboratory test results on selected soil samples obtained indicate the following soil classifications, field blowcounts and amounts of fines passing through the No. 200 sieve.

### Field Blowcount and Gradation Data

| <u>Location</u> | <u>Classification</u> | <u>Blowcounts<br/>(blows/ft)</u> | <u>Relative<br/>Density</u> | <u>% Passing<br/>No. 200 Sieve</u> |

| B-1 @ 50'       | ML                    | 31                               | Stiff                       | 53                                 |

Based upon information in the San Bernardino County Land Use Plan "Geologic Hazard Maps (2009)", the subject site is situated in an area of high generalized liquefaction susceptibility. Groundwater records from the Chino Basin Water Master (CBWM) Fall 2006 reveals groundwater to be about 50 feet in depth. Review of ground water maps of the Upper Santa Ana River Basin (Carson and Matti, 1982) shows historical groundwater depths to be about 30 feet. Our liquefaction evaluation utilized the nearest node of predominate magnitude 6.7 Mw earthquake with a 10% exceedance in 50 years peak horizontal ground acceleration of 0.93g and indicates a low liquefaction potential.

The associated seismic-induced settlements would be on the order of less than one inch and should occur rather uniformly across the site. Differential settlements should be on the order of less than ½ inch over a 50 feet (horizontal) distance in the building area with our calculations given in Appendix C.

## **7.0 Conclusions and Recommendations**

Based upon our evaluations, the proposed development is acceptable from a geotechnical engineering standpoint. By following the recommendations and guidelines set forth in our report, the structures and grading will be safe from settlements under the anticipated design loadings and conditions. The proposed development shall meet all requirements of the City Building Ordinance and will not impose any adverse effect on existing adjacent structures.

The following recommendations are based upon geotechnical conditions encountered in our field investigation and laboratory data. Therefore, these surface and subsurface conditions could vary across the site. Variations in these conditions may not become evident until the commencement of grading operations and any unusual conditions which may be encountered in the course of the project development may require the need for additional study and revised recommendations.

It is recommended that site inspections be performed by a representative of this firm during all grading and construction of the development to verify the findings and recommendations documented in this report. The following sections present a discussion of geotechnical related requirements for specific design recommendations of different aspects of the project.

### **7.1.1 Removal and Recomaction Recommendations**

All fill soils (about 1 to 6 feet) shall be removed to competent native material, the exposed surface scarified to a depth of 6 inches, brought to within 2% of optimum moisture content and compacted to a minimum of 90% of the laboratory standard (ASTM: D-1557-07) prior to placement of any additional compacted fill soils, foundations, slabs-on-grade and pavement. Grading shall extend a minimum of five horizontal feet outside the edges of foundations or equidistant to the depth of fill placed, whichever is greater.

It is possible that isolated areas of undiscovered fill not described in this report are present on site. If found, these areas should be treated as discussed earlier. A diligent search shall also be conducted during grading operations in an effort to uncover any underground structures, irrigation or utility lines. If encountered, these structures and lines shall be either removed or properly abandoned prior to the proposed construction.

Any imported fill material should be preferably soil similar to the upper soils encountered at the subject site. All soils shall be approved by this firm prior to importing at the site and will be subjected to additional laboratory testing to assure concurrence with the recommendations stated in this report.

Care should be taken to provide or maintain adequate lateral support for all adjacent improvements and structures at all times during the grading operations and construction phase. Adequate drainage away from the structures, pavement and slopes should be provided at all times.

If placement of slabs-on-grade and pavement is not completed immediately upon completion of grading operations, additional testing and grading of the areas may be necessary prior to continuation of construction operations. Likewise, if adverse weather conditions occur which may damage the subgrade soils, additional assessment by the geotechnical engineer as to the suitability of the supporting soils may be needed.

#### **7.1.2 Fill Blanket Recommendations**

Due to the potential for differential settlement of foundations placed on compacted fill and the upper native soils, it is recommended that all foundations be underlain by a uniform compacted fill blanket at least three feet in thickness. This fill blanket shall extend a minimum of five horizontal feet outside the edges of foundations or equidistant to the depth of fill placed, whichever is greater.

## 7.2 **Shrinkage and Subsidence**

Results of our in-place density tests reveal that the soil shrinkage will be on the order of 10 to 15% due to excavation and recompaction, based upon the assumption that the fill is compacted to 92% of the maximum dry density per ASTM standards. Subsidence should be 0.2 feet due to earthwork operations. The volume change does not include any allowance for vegetation or organic stripping, removal of subsurface improvements or topographic approximations. Although these values are only approximate, they represent our best estimate of lost yardage, which will likely occur during grading. If more accurate shrinkage and subsidence factors are needed, it is recommended that field testing using the actual equipment and grading techniques should be conducted.

## 7.3 **Temporary Excavations**

Temporary unsurcharged excavations in the existing site materials less than 4 feet high may be made at a vertical gradient unless cohesionless soils are encountered. In areas where soils with little or no binder are encountered, where adverse geological conditions are exposed, or where excavations are adjacent to existing structures, shoring, slot-cutting, or flatter excavations may be required. Additional recommendations regarding specific excavations may be calculated once typical detail sections are made available.

The temporary cut slope gradients given do not preclude local raveling and sloughing. All excavations shall be made in accordance with the requirements of CAL-OSHA and other public agencies having jurisdiction. Care should be taken to provide or maintain adequate lateral support for all adjacent improvements and structures at all times during the grading operations and construction phase.

## 7.4 **Foundation Design**

All foundations may be designed utilizing the following safe bearing capacities for an embedded depth of 24 inches into approved-engineered fill with the corresponding widths:

**Allowable Safe Bearing Capacity (psf)**

| <u>Width (ft)</u> | <u>Continuous Foundation</u> | <u>Isolated Foundation</u> |
|-------------------|------------------------------|----------------------------|
| 1.5               | 1800                         | 2300                       |
| 2.0               | 1875                         | 2375                       |
| 4.0               | 2175                         | 2675                       |
| 6.0               | 2475                         | 2975                       |

The bearing value may be increased by 500 psf for each additional foot of depth in excess of the 24-inch minimum depth, up to a maximum of 4,000 psf. A one third increase may be used when considering short-term loading and seismic forces. Any foundations where overexcavation is not performed laterally or beneath foundation areas should utilize a safe bearing capacity of 1,000 psf.

All continuous foundations shall be reinforced with a minimum of one No. 4 bar, top and bottom; isolated pad foundations shall be reinforced at the discretion of the project structural engineer. A representative of this firm shall inspect all foundation excavations prior to pouring concrete.

**7.5 Settlement Analysis**

Resultant pressure curves for the consolidation tests are shown on Plates C and D. Computations utilizing these curves and the recommended safe bearing capacities reveal that the foundations will experience settlements on the order of 3/4 inch and differential settlements of less than 1/4 inch. This differential settlement should occur over a minimum horizontal distance of 20 feet.

**7.6 Lateral Resistance**

The following values may be utilized in resisting lateral loads imposed on the structure. Requirements of the Uniform Building Code should be adhered to when the coefficient of friction and passive pressures are combined.

Coefficient of Friction - 0.35

Equivalent Passive Fluid Pressure = 200 lbs./cu.ft.

Maximum Passive Pressure = 2,000 lbs./cu.ft.

The passive pressure recommendations are valid only for approved compacted fill soils.

### 7.7 **Retaining Wall Design Parameters**

Active earth pressures against retaining walls will be equal to the pressures developed by the following fluid densities. These values are for **granular backfill material** placed behind the walls at various ground slopes above the walls.

| Surface Slope of Retained Materials<br>( <u>Horizontal to Vertical</u> ) | Equivalent Fluid<br>Density ( <u>lb./cu.ft.</u> ) |
|--|---|
| Level  | 30  |
| 5 to 1   | 35  |
| 4 to 1   | 38  |
| 3 to 1   | 40  |
| 2 to 1   | 45  |

Any applicable short-term construction surcharges and seismic forces should be added to the above lateral pressure values. A backfill zone of non-expansive material shall consist of a wedge beginning a minimum of one horizontal foot from the base of the wall extending upward at an inclination no less than 1/4 to 1 (horizontal to vertical). All walls shall be waterproofed as needed and protected from hydrostatic pressure by a reliable permanent subdrain system.

### 7.8 **Slab Design**

All new concrete slabs shall be at least six inches in the proposed warehouse areas and four inches in office and hardscape areas, all reinforced using No. 3 bars at sixteen inch spacing in each direction and positioned in the center of the slab. Additional reinforcement requirements and an increase in thickness of the slabs-on-grade may be necessary based upon soils expansion potential and proposed loading conditions in the structures and should be evaluated further by the project engineers and/or architect. These slabs shall be placed on approved subgrade soils moisture conditioned to above optimum moisture content to a depth of twelve inches.

A vapor retarder should be utilized in areas which would be sensitive to the infiltration of moisture. This retarder shall meet requirements of ASTM E 96, *Water Vapor Transmission of Materials* and ASTM E 1745, *Standard Specification for Water Vapor Retarders used in Contact with Soil or Granular Fill Under Concrete Slabs*. The vapor retarder shall be installed in accordance with procedures stated in ASTM E 1643, *Standard practice for Installation of Water Vapor Retarders used in Contact with Earth or Granular Fill Under Concrete Slabs*.

The moisture retarder may be placed directly upon approved subgrade soils, although one to two inches of sand beneath the membrane is desirable. The subgrade upon which the retarder is placed shall be smooth and free of rocks, gravel or other protrusions which may damage the retarder. Use of sand above the retarder is under the purview of the structural engineer; if sand is used over the retarder, it should be placed in a dry condition.

#### 7.9 **Pavement Section Design**

The table below provides a preliminary pavement design based upon an R-Value of 30 for the proposed pavement areas. Final pavement design may need to be based on R-Value testing of the subgrade soils near the conclusion of rough grading to assure that these soils are consistent with those assumed in this preliminary design.

| <u>Type of Traffic</u>                    | <u>Traffic Index</u> | <u>Asphaltic Concrete (in)</u> | <u>Base Material (in)</u> |
|---|----------------------|--------------------------------|---------------------------|
| Parking Stalls                            | 4.0                  | 3.0                            | 4.0                       |
| Light Vehicle Circulation Areas           | 5.5                  | 3.5                            | 6.5                       |
| Heavy Truck<br>(GVW < 90,000 lbs; 5-axle) | 7.0                  | 4.0                            | 10.0                      |

All concrete slabs to be utilized for pavement shall be a minimum of seven inches in thickness and placed on approved subgrade soils. The recommendations are based upon estimated traffic loads. Client should submit anticipated traffic loadings, when available, so that pavement sections may be reviewed to determine adequacy to support these loads.

All pavement areas shall have positive drainage toward an approved outlet from the site. Drain lines behind curbs and/or adjacent to landscape areas should be considered by client and the appropriate design engineers to prevent water from infiltrating beneath pavement. If such infiltration occurs, damage to pavement, curbs and flow lines, especially on sites with expansive soils, may occur during the life of the project.

Any approved base material shall consist of a Class II aggregate or equivalent and should be compacted to a minimum of 95% relative compaction. All pavement materials shall conform to the requirements set forth by the City of San Bernardino . The base material and asphaltic concrete should be tested prior to delivery to the site and during placement to determine conformance with the project specifications. A pavement engineer shall designate the specific asphalt mix design to meet the required project specifications.

#### 7.10 **Utility Trench and Excavation Backfill**

Trenches from installation of utility lines and other excavations may be backfilled with on-site soils or approved imported soils compacted to a minimum of 90% relative compaction. All utility lines shall be properly bedded with clean sand having a sand equivalency rating of 30 or more. This bedding material shall be thoroughly water jetted around the pipe structure prior to placement of compacted backfill soils.

#### 7.11 **Corrosion Design Criteria**

Representative samples of the surficial soils, typical of the subgrade soils expected to be encountered within foundation excavations and underground utilities were tested for corrosion potential. The minimum resistivity value obtained for the samples tested is representative of an environment that may be severely corrosive to metals. The soil pH value was considered mildly alkaline and may not have a significant effect on soil corrosivity. Consideration should be given to corrosion protection systems for buried metal such as protective coatings, wrappings or the use of PVC where permitted by local building codes.

According to Table 4.3.1, ACI 318 Building Code and Commentary, these contents revealed negligible levels of sulfate exposure. Therefore, a Type II cement according to latest CBC specifications may be utilized for building foundations at this time. Additional sulfate tests shall be performed at the completion of site grading to assure that these soils are consistent with the recommendations stated in this design. Corrosion test results may be found on the attached Table IV.

#### 7.12 **Expansive Soil**

Since expansive soils were encountered, special attention should be given to the project design and maintenance. The attached *Expansive Soil Guidelines* should be reviewed by the engineers, architects, owner, maintenance personnel and other interested parties and considered during the design of the project and future property maintenance.

#### 8.0 **Closure**

The recommendations and conclusions contained in this report are based upon the soil conditions uncovered in our test excavations. No warranty of the soil condition between our excavations is implied. NorCal Engineering should be notified for possible further recommendations if unexpected to unfavorable conditions are encountered during construction phase. It is the responsibility of the owner to ensure that all information within this report is submitted to the Architect and appropriate Engineers for the project.

This firm should have the opportunity to review the final plans to verify that all our recommendations are incorporated. A preconstruction conference should be held between the developer, general contractor, grading contractor, city inspector, architect, and soil engineer to clarify any questions relating to the grading operations and subsequent construction. Our representative should be present during the grading operations and construction phase to certify that such recommendations are complied within the field.

This geotechnical investigation has been conducted in a manner consistent with the level of care and skill exercised by members of our profession currently practicing under similar conditions in the Southern California area. No other warranty, expressed or implied is made.

We appreciate this opportunity to be of service to you. If you have any further questions, please do not hesitate to contact the undersigned.

Respectfully submitted,  
NORCAL ENGINEERING

Keith D. Tucker  
Project Engineer  
R.G.E. 841

Scott D. Spensiero  
Project Manager

## **SPECIFICATIONS FOR PLACEMENT OF COMPACTED FILL**

### **Excavation**

Any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90% relative compaction (in accordance with ASTM: D-1557). In any area where a transition between fill and native soil or between bedrock and soil are encountered or other areas as required in this report, additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and avoid differential settlement of the structure. Verification of elevations during this work and all grading operations will be the responsibility of the owner or his designated representative and not NorCal Engineering.

### **Material For Fill**

The on-site soils or approved import soils may be utilized for the compacted fill provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation of site.

### **Placement of Compacted Fill Soils**

The approved fill soils shall be placed in layers not excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2% of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90% relative compaction (in accordance with ASTM: D-1557) and approved prior to the placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every 2 feet of compacted fill placed.

The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be in a dense and smooth condition prior to placement of slabs-on-grade or pavement areas. No fill soils shall be placed, spread or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm.

### **Grading Observations**

The controlling governmental agencies should be notified prior to commencement of any grading operations. This firm recommends that the grading operations be conducted under the observation of a Soils Engineering firm as deemed necessary. A 24 hour notice must be provided to this firm prior to the time of our initial inspection.

Observation shall include the clearing and grubbing operations to assure that all unsuitable materials have been properly removed; approve the exposed subgrade in areas to receive fill and in areas where excavation has resulted in the desired finished grade and designate areas of overexcavation; and perform field compaction tests to determine relative compaction achieved during fill placement. In addition, all foundation excavations shall be observed by the Soils Engineering firm to confirm that appropriate bearing materials are present at the design grades and recommend any modifications to construct footings.

## Expansive Soil Guidelines

The following expansive soil guidelines are provided for your project. The intent of these guidelines is to inform you, the client, of the importance of proper design and maintenance of projects supported on expansive soils. ***You, as the owner or other interested party, should be warned that you have a duty to provide the information contained in the soil report including these guidelines to your design engineers, architects, landscapers and other design parties in order to enable them to provide a design that takes into consideration expansive soils.***

*In addition, you should provide the soil report with these guidelines to any property manager, lessee, property purchaser or other interested party that will have or assume the responsibility of maintaining the development in the future.*

Expansive soils are fine-grained silts and clays which are subject to swelling and contracting. The amount of this swelling and contracting is subject to the amount of fine-grained clay materials present in the soils and the amount of moisture either introduced or extracted from the soils. Expansive soils are divided into five categories ranging from “very low” to “very high”. Expansion indices are assigned to each classification and are included in the laboratory testing section of this report. *If the expansion index of the soils on your site, as stated in this report, is 21 or higher, you have expansive soils.* The classifications of expansive soils are as follows:

### Classification of Expansive Soil\*

| Expansion Index | Potential Expansion |
|-----------------|---------------------|
| 0-20            | Very Low            |
| 21-50           | Low                 |
| 51-90           | Medium              |
| 91-130          | High                |
| Above 130       | Very High           |

When expansive soils are compacted during site grading operations, care is taken to place the materials at or slightly above optimum moisture levels and perform proper compaction operations. Any subsequent excessive wetting and/or drying of expansive soils will cause the soil materials to expand and/or contract. These actions are likely to cause distress of foundations, structures, slabs-on-grade, sidewalks and pavement over the life of the structure. ***It is therefore imperative that even after construction of improvements, the moisture contents are maintained at relatively constant levels, allowing neither excessive wetting or drying of soils.***

Evidence of excessive wetting of expansive soils may be seen in concrete slabs, both interior and exterior. Slabs may lift at construction joints producing a trip hazard or may crack from the pressure of soil expansion. Wet clays in foundation areas may result in lifting of the structure causing difficulty in the opening and closing of doors and windows, as well as cracking in exterior and interior wall surfaces. In extreme wetting of soils to depth, settlement of the structure may eventually result. Excessive wetting of soils in landscape areas adjacent to concrete or asphaltic pavement areas may also result in expansion of soils beneath pavement and resultant distress to the pavement surface.

Excessive drying of expansive soils is initially evidenced by cracking in the surface of the soils due to contraction. Settlement of structures and on-grade slabs may also eventually result along with problems in the operation of doors and windows.

*Projects located in areas of expansive clay soils will be subject to more movement and "hairline" cracking of walls and slabs than similar projects situated on non-expansive sandy soils.* There are, however, measures that developers and property owners may take to reduce the amount of movement over the life the development. The following guidelines are provided to assist you in both design and maintenance of projects on expansive soils:

- Drainage away from structures and pavement is essential to prevent excessive wetting of expansive soils. Grades should be designed to the latest building code and maintained to allow flow of irrigation and rain water to approved drainage devices or to the street. Any “ponding” of water adjacent to buildings, slabs and pavement after rains is evidence of poor drainage; the installation of drainage devices or regrading of the area may be required to assure proper drainage. Installation of rain gutters is also recommended to control the introduction of moisture next to buildings. Gutters should discharge into a drainage device or onto pavement which drains to roadways.
- Irrigation should be strictly controlled around building foundations, slabs and pavement and may need to be adjusted depending upon season. This control is essential to maintain a relatively uniform moisture content in the expansive soils and to prevent swelling and contracting. Over-watering adjacent to improvements may result in damage to those improvements. NorCal Engineering makes no specific recommendations regarding landscape irrigation schedules.
- Planting schemes for landscaping around structures and pavement should be analyzed carefully. Plants (including sod) requiring high amounts of water may result in excessive wetting of soils. Trees and large shrubs may actually extract moisture from the expansive soils, thus causing contraction of the fine-grained soils.
- Thickened edges on exterior slabs will assist in keeping excessive moisture from entering directly beneath the concrete. A six-inch thick or greater deepened edge on slabs may be considered. Underlying interior and exterior slabs with 6 to 12 inches or more of non-expansive soils and providing presaturation of the underlying clayey soils as recommended in the soil report will improve the overall performance of on-grade slabs.

- Increase the amount of steel reinforcing in concrete slabs, foundations and other structures to resist the forces of expansive soils. The precise amount of reinforcing should be determined by the appropriate design engineers and/or architects.
- Recommendations of the soil report should always be followed in the development of the project. Any recommendations regarding presaturation of the upper subgrade soils in slab areas should be performed in the field and verified by the Soil Engineer.

NOTE: DUAL SYMBOLS ARE USED TO INDICATE BORDERLINE SOIL CLASSIFICATIONS

## UNIFIED SOIL CLASSIFICATION SYSTEM

**KEY:**

- Indicates 2.5-inch Inside Diameter. Ring Sample.
- ☒ Indicates 2-inch OD Split Spoon Sample (SPT).
- ◻ Indicates Shelby Tube Sample.
- ▢ Indicates No Recovery.
- ▣ Indicates SPT with 140# Hammer 30 in. Drop.
- ☑ Indicates Bulk Sample.
- ▤ Indicates Small Bag Sample.
- ▥ Indicates Non-Standard
- ⊠ Indicates Core Run.

**COMPONENT PROPORTIONS**

| DESCRIPTIVE TERMS | RANGE OF PROPORTION |
|-------------------|---------------------|
| Trace             | 1 - 5%              |
| Few               | 5 - 10%             |
| Little            | 10 - 20%            |
| Some              | 20 - 35%            |
| And               | 35 - 50%            |

**COMPONENT DEFINITIONS**

| COMPONENT     | SIZE RANGE                                 |
|---------------|--|
| Boulders      | Larger than 12 in                          |
| Cobbles       | 3 in to 12 in                              |
| Gravel        | 3 in to No 4 (4.5mm )                      |
| Coarse gravel | 3 in to 3/4 in                             |
| Fine gravel   | 3/4 in to No 4 ( 4.5mm )                   |
| Sand          | No. 4 ( 4.5 mm ) to No. 200 ( 0.074mm )    |
| Coarse sand   | No. 4 ( 4.5 mm ) to No. 10 ( 2.0 mm )      |
| Medium sand   | No. 10 ( 2.0 mm ) to No. 40 ( 0.42 mm )    |
| Fine sand     | No. 40 ( 0.42 mm ) to No. 200 ( 0.074 mm ) |
| Silt and Clay | Smaller than No. 200 ( 0.074 mm )          |

**MOISTURE CONTENT**

|       |  |
|-------|--|
| DRY   | Absence of moisture, dusty, dry to the touch.          |
| DAMP  | Some perceptible moisture; below optimum               |
| MOIST | No visible water; near optimum moisture content        |
| WET   | Visible free water, usually soil is below water table. |

**RELATIVE DENSITY OR CONSISTENCY VERSUS SPT N -VALUE**

| COHESIONLESS SOILS |                | COHESIVE SOILS |               |  |
|--------------------|----------------|----------------|---------------|--|
| Density            | N ( blows/ft ) | Consistency    | N (blows/ft ) | Approximate Undrained Shear Strength (psf) |
| Very Loose         | 0 to 4         | Very Soft      | 0 to 2        | < 250                                      |
| Loose              | 4 to 10        | Soft           | 2 to 4        | 250 - 500                                  |
| Medium Dense       | 10 to 30       | Medium Stiff   | 4 to 8        | 500 - 1000                                 |
| Dense              | 30 to 50       | Stiff          | 8 to 15       | 1000 - 2000                                |
| Very Dense         | over 50        | Very Stiff     | 15 to 30      | 2000 - 4000                                |
|                    |                | Hard           | over 30       | > 4000                                     |
